Tear away the old cover of

RE/P.

It's the 1990s, and we're the first to admit that our 20-year-old title — Recording Engineer/Producer — doesn't begin to describe what today's working audio professional does on a daily basis. From this day on, we're R•E•P — the Pro Audio Applications Magazine for Recording, Engineering and Production.

It's too limiting to say that this magazine exists only for recording engineers and record producers. R•E•P also addresses audio pros involved in post-production; digital recording, assembly and editing; music creation; sound reinforcement, radio and TV broadcasting; commercial spot production; industrial multimedia; mastering and duplication; and studio design.

Although the name is updated, R•E•P will continue to present the applications-oriented material we've published for more than 20 years. R•E•P will continue to provide the information you need to work smarter and more profitably, from real, usable product reviews to business and production insights.

The audio world is changing, and R•E•P will help you face the challenges of that world, through the 1990s and beyond.

AN INTERTEC PUBLICATION

Attention Otari and Sony/MCI Customers:
'Now you can afford Studer quality
and performance'

Studer quality and performance has just entered your price range with the affordable—*very* affordable—A827 studio recorder, the first new multichannel from Studer since its standard-setting A820-24.

Superior sound for music recording. The A827 is just plainly ahead of the competition. And why shouldn't it be? With the same transport and head assembly, the same audio quality as its big brother, the A827 is without doubt in the Studer class in spite of its

affordable price. Available in 24, 16 and 8-track versions, the A827 features a computer controlled transport with 3 tape speeds, varispeed, switchable Dolby HX® Pro and phase compensated audio electronics.

Featured for post production. For TV/Video/Film post production work, the A827 offers the fastest transport in the business—0 to 600 ips in 4 seconds—and with 14" reel capacity. The optional chase lock synchronizer guarantees nobody'll be waiting on *this* machine. Post features like Reverse Play/Record and parallel/serial RS232/422 control ports make for easy integration into post production facilities.

There's never been a better time to part ways with those "other" machines...and move up to the famous Studer sound and quality. Call us. Experience the new A827-24 with the best price/performance ratio available.

THE NEVE PRISM SERIES

Discover The Full Spectrum Of Sound

With the Neve Prism Series, there's a whole new world of sound waiting to be discovered.

The Prism Series offers the unsurpassed EQ and dynamics capabilities of the Neve VR Series console — the console of choice in today's leading recording and post-production facilities — in one extremely powerful and flexible rack-mount package. The two Prism modules include the four-band parametric equalizer and the mic amp/dynamics unit, consisting of compressor/limiter/gate/expander. In addition, the mic amp/dynamics unit also has a mic input and variable high and low pass filters for unmatched definition, clarity, and size of sound.

The competitively priced Prism Series is even more affordable with our own Siemens financing. No matter what kind of work you do, the Neve Prism Series will enhance it dramatically.

*Take a look at the Neve Prism Series...

IF A•DAM IS JUST ANOTHER
DIGITAL MULTI-TRACK,
STEVIE IS JUST ANOTHER MUSICIAN.

You know how good this guy is. For total musical abilities there's simply no one better. So when an impressive guy like Stevie tells us he's real impressed with A•DAM, its music to our ears.

Well, what Stevie is doing for music, Akai is doing for digital multi-track. A•DAM. The world's first portable digital multi-track, with the convenience of universally accepted 8mm tape, gives you the flexibility to expand to 36 tracks. It's the only digital machine within the means of any professional application.

A•DAM is the ultimate satellite multi-track. In a midi facility, A•DAM is the ideal primary machine because its SMPTE

compatibility lets you devote 12 digital tracks to vocals. And with single frame editing, you can now eliminate the most difficult breaths and pops with absolute precision.

A•DAM. Just another wonder from Akai. Call today for the authorized AKAI Digital dealer nearest you.

MORE ARTISTS GO GOLD ON AMPEX THAN ON ALL OTHER TAPES PUT TOGETHER

EVERY ARTIST PICTURED HERE HAS EARNED THE PRESTIGIOUS
Ampex Golden Reel Award for creating a gold album exclusively on Ampex audio tape. In fact, of all the gold albums released last year—and the year before—most of them were laid down exclusively on Ampex tape. And it's a good bet that most of the others used Ampex for the majority of their cuts, too. • At Ampex, we respect the art of music and the rare ability it takes to create it. Being an artist means committing your body, mind and soul to your profession. It means fighting to preserve the integrity of your talent. It means never compromising your sound. • We've made our own commitment to provide you with the highest quality, most consistent, most dependable audio tape in the world. Tape created with the same uncompromising attention to detail that you bring to your music. • For all the details on what makes Ampex tape right for your sound, just call or write for a copy of our new 456 Technical Brochure, and see why Grand Master[®] 456 is engineered like no other tape in the world.

AMPEX
A MASTER OF ENGINEERING

Incredible stereo. Great imaging. No trade-offs.

Until now, there have been only two choices for stereo microphones.

Mid side and X-Y mics gave good mono compatibility but produced wishy-washy imaging and sacrificed ambience. The second choice, near-coincident pairs, produced sharper imaging at the expense of poor mono compatibility and required awkward stands and field assembled parts.

Either way, low end has been weak and off-axis coloration lurked in the background.

All that has changed with the introduction of Crown's

Stereo Ambient Sampling System™: SASS™. Now, two new choices are available, each with no sacrifice in performance.

SASS-P with switchable battery or phantom power and Crown's best studio grade PZM capsules; or SASS-B to utilize the world standard Bruel & Kjaer 4003 and 4006 studio mics.

Full ambience without coloration, excellent sum to mono and an extraordinarily broad frequency response, SASS offers fantastic imaging with pinpoint

localization for both music and non-music sources.

It's all done within a single, lightweight, Crown-patented frame that is easily adaptable to all common stands and mounts. A cushioned grip is provided for hand-held applications.

On one hand, portability and impressive high end; on the other, ultraquiet response to the lowest audible frequency. Both SASS models have it all.

See your Crown representative. You'll find the new SASS family stands alone as THE choice for stereo. No trade-offs.

From the Top

Future History

Once upon a time, say 20 years ago, things were more clear. People in the audio industry were usually musicians or broadcasters before they gravitated behind the mixing board. Others did PA, embryonically developing the sound reinforcement business somewhere in back alleys and garages.

Our magazine, created in 1970 and nicknamed RE/P in the first issue, fit perfectly in that neat, distinct world where studios did music, radio stations did voice-overs, and film houses did looping and transfers. Identifying a need, the magazine addressed all of the important issues pertinent to the job of manipulating technology for the creation of audio art, whether produced between four walls or out in a field.

RE/P magazine (past tense) continually broke new ground at higher elevations, originating articles that addressed the gamut of professional audio production, from studio work to field recording, from equipment design to post production, from interviews with chart-tracking producers to features on megawatt touring sound systems.

Over the years, the rapid appearance and development of various storage mediums, equipment platforms and production techniques redefined the industry again and again. The greatly downpriced availability of equipment from companies such as Tascam and Fostex, not to mention electronic desktop editing and sound manipulation, allowed expanded audio production without the capital investment that was once needed.

Albums, scores, demos, soundtracks and commercials could be generated in back offices, warehouses and bedrooms, in facilities fully equipped for the price of a luxury car. Professional, commercial audio production became the domain of musicians, marketing specialists, creative art types and media departments, in addition to the traditional industry job titles.

Video and computer hardware took root and bloomed in previously audio-only environments. Compact affordable video with expanded audio capabilities created an entire support industry. Sync-to-everything became more than a promise.

Today, out of the swirling fog of technological uncertainty, solid images are starting to coalesce. The producer (small "p") of a project today has the capability to become a

1-man band, writing, directing, programming, performing, recording, mixing and marketing in multiple mediums.

Case in point: the guy who aligns the synced double 24-tracks at dawn, then directs and cuts voice-over talent to hard disc over imported digital tracks (spun off on DAT), assembles, edits and lays-back an agency Mac computer-generated commercial donut to D2, audio and video, still store/frame grabs a shot for the DTP'd PR piece, takes off his tie and completes basics for a heavy-chromium glam-band as engineer/producer in the afternoon and mixes his brother's neo-folk act at the downtown showcase club that night over his own rental PA system. Tomorrow he does the Lambada.

Question: What is this guy's job title? What does he do for a living? Answer: Audio production. Welcome to the Nineties.

We at RE/P (present tense) recognize the traverses occurring today. In this post VH-1, sound byte, bigger-than-real world where it all eventually goes to video, and the marketability of production values is everything, we are updating to match the times.

With this issue, we are introducing a shortened title and a new tag line to more truly image the changes that our media industry is undergoing. From now on, the magazine is officially RE•E•P — short, sweet, simple. The title no longer reflects a job description — the recording engineer/producer — but addresses what people in our industry do by vocation: audio recording, audio engineering and audio production. RE•E•P.

We are also updating the department titles to more closely reflect subjects that are currently achieving critical mass: Random Access, an information hotline; Digital Domain, on digital hardware, software and disc-based recording; Sound Business, where SPARS does its usual exemplary job of explaining how to stay in business; and First Look, a timely peek at the latest product introductions. The titles may be new, but the material covered is exactly the type that made the magazine a prime source for useful and practical pro audio info.

We believe that positive change is good and regularly needed to keep from becoming dinosauric. With this in mind, we hope you enjoy the new, fresh writers we have recruited and the overall forward-leaning spin that is presented in these pages. Let us know what you think.

Mike Joseph
Technical Editor

What About Art?

By Piper Stevenson

Glancing through the pages of this magazine, you will quickly realize how exciting the music biz can be. We have it all: great equipment with astounding capabilities, proliferating software algorithms to suit even the wildest dreams, all on an ever-expanding technological horizon.

With so many great things going for our tight little industry, it is no wonder that so few of us sit back and take time to listen to the fruits that grow on the technological vine. If we did take more time to consider the art form, I think we would be ashamed of ourselves.

By placing such a premium on the value of the technology we use to create sound recordings, we have lessened the primary source of our existence: the musical experience.

Specifically, the greatest percentage of contemporary album-oriented music is technical masturbation — nothing more, nothing less. Studio projects are born from partially related electro-mechanical events, combined into preconceived, acceptable formats palatable to the casual radio listener.

Today's audio engineer has crafted a "manufactured" recording process that rarely challenges the listening audience. The root of this difficulty extends outwardly and involves two interactive branches: A large percentage of today's musical performances are sub-standard; and the technology used to record these performances is often utilized to correct the deficiencies of the primary art of creating the music.

In a nutshell, we have lost sight (or is it sense of hearing?) of what makes the art form interesting and viable. Our eyes glimmer at the latest mixing console, multitrack recorder or digital workstation. What we fail to notice is that while the technology has advanced, the talent who use the gear — and as important, those who perform — have not progressed accordingly. In the process of searching for that "perfect piece of gear," we have ended up cheating the listener by placing technology before art.

Engineers, producers and musicians have utilized their wares to only a fraction

of their capabilities. Nevertheless, the musical compositions are often recorded for the sake of equipment — rather than for art.

If you need some proof, think back to your favorite pre-1970 recordings. Songs recorded on meager 4-track recorders are still enjoyed today, not because they are technically mystic. Rather, they exist as art forms, surpassing the standards that neither time nor technology can denigrate.

To further drive my point home, recall when stereo recordings were first introduced. Those particular recordings that exploited the capabilities of the stereo field (i.e.: discrete channel muting and/or the bombastic usage of panning) resulted in recordings that often lessened the quality of the complete work. Why? Because technology superseded the medium to which they were attached.

We've lessened the primary source of our existence: the musical experience.

Today, unfortunately, little has changed. I say this with some reservation, of course, because technology has advanced well beyond the imagination of the early stereo pioneers. As a self-acknowledged promoter of MIDI, sampling, digital recordings and workstations, I have many opportunities to use equipment, often to my own disadvantage — often more so to the disadvantage of the artist or listener. Perhaps you, too, have been in similar situations as you practice your craft. Because you can "save a take" using high-tech, you do. What about doing it right in the first place?

How often, for example, have you been told, "It's gonna be heard on a 4-inch TV speaker, why waste your time?" Or better still, "The guy who watches MTV doesn't monitor with Perraux Amps and Genelecs ... why should you?" Did you agree with your heckler and say, "Yeah, you're right — the music can stand on its own." Probably not. Instead, you likely spent several hours remixing and tightening the sound invoking every imaginable studio technique, technology and creative juice in your body.

Don't get me wrong — I am all for en-

gineering that enhances the primary recording. However, when you start your sessions with poorly written compositions, there is little you can do as an engineer to make the songs more listenable or enjoyable. I am not downplaying the technical advances we have made, just our reliance on them. We are losing touch with the purpose of our actions.

Throughout all of the technical proliferation, the consumer has become educated and is now keenly aware of the advancements afforded in sound recordings. Unfortunately, many of us — including myself — have postured the equipment well ahead of the art form and, in doing so, have lessened the effectiveness of our recordings.

In an effort to produce recordings with the greatest fidelity, we have lost sight of the fundamental principal that enables the medium to exist — the music itself. While we have spent time endlessly searching for the greatest gear, perhaps we should stop and begin searching for greater talent.

So what can you do to cultivate your own talent? Here are some steps:

1. Listen to recordings of music that you don't deal with in the studio. If you mainly do rock 'n' roll, listen to classical or folk. Get a feel for what your peers in these other disciplines are trying to accomplish.

2. Attend live performances in clubs or concert halls. It doesn't matter if you work with that type of music every day. The point is to be thoroughly familiar with how the performance occurs outside of the controlled environment of the recording studio.

3. Re-acquaint yourself with the basics of recording. Before you can break the rules, you have to know what they are. Know what the best technique is for the effect you are achieving. Don't merely use techniques because it is the latest and coolest.

The music industry needs to cultivate a stable of talented individuals comprised of creative musicians and engineers. We need people who realize that the artform existed long before the integrated circuit. Until we do this, our technologically over-produced recordings are worthless; they are an engineering experience gone haywire. ■

Did you know Record Plant uses

AGFA

Bonnie Raitt's Grammy Album of the Year, Nick of Time, is more than just overdue recognition. It's a tribute to trust, faith and friends.

Engineer Ed Cherney, producer Don Was, and the Record Plant in L.A. — all helped Bonnie turn out the album of her career, mixed on AGFA PEM 468.

Listen closely and you'll hear a warmth much deeper than guitar licks. A legendary studio, a great team, and a perfect mix on an exceptional audio mastering tape.

Nick of Time. It's more than just the album of the year. And more than any person or product involved. It's testimony to how great music can sound when it all comes together — when an album's recorded with a "Thing Called Love."

AGFA 

CONSOLIDATION ...CONTINUED

U.S. & BRITISH STUDIOS:

What are the Differences?

Pro audio buyouts, acquisitions and mergers continued this spring. Two companies with active acquisition histories each picked up a company, and an audio pioneer decided to sell out a multinational conglomerate.

Dr. Willi Studer, the founder and sole shareholder of the Studer Revox Group, sold out to SAEG Refindus Holding Inc., a Swiss company. The sale was initially announced at the AES Montreux show, but was announced domestically at the NAB convention in Atlanta in April. Tore Nordahl, president of Studer Revox America, which acquired Dyaxis last fall, said he did not think the acquisition would affect American operations.

Mark IV Audio, which has been an acquisition trend the past couple of years, has acquired Dynacord, the West German manufacturer of music and commercial sound products. The company will continue to operate separately with its present management. An American company, Dynacord Electronics, has been formed and will be based in Los Alamitos, CA.

Robert Pabst, Mark IV Audio president, said that Dynacord's technology in digital electronics will be used to develop products in the other Mark IV companies. The fact that Dynacord has a strong European presence was undoubtedly a factor, as the European Economic Community becomes a reality in 1992.

The third acquisition was DOD Electronics, with product lines DOD, DigiTech and Audio Logic, purchased by Harmon International, the owner of JBL, UREI and Soundcraft. According to the agreement, DOD will retain control over its distributor network and will operate autonomously. ■

are there differences between American and British studios? Bruce Forest, an American re-mix engineer who has been working in Britain for the past few months, thinks so.

Like many re-mixers, Forest started as a club DJ in New York; he got his big break from Chris Blackwell of Island Records. He has re-mixed records from Steve Winwood, Madonna, Whitney Houston and Paul McCartney. When he went to London for a party and a couple of remixes, Forest stretched his week-long visit into months. He offers these thoughts on the differences between American and British studios:

"In the U.S., when I agree to do a mix, I first sort out the budget and see if the room I want is available. Then I scout around for a keyboard player and see if I can get ahold of the artist — that's almost unheard of. Then I get all the equipment together, turn up at the studio on the day of the mix and pounce around for half a day, trying to get it all working.

"Over here it's different. When I came to do the ABC track, I was thinking, 'Oh my God, who am I going to get for overdubs? Where am I going to get the equipment? Where am I going to find a good engineer?' When I showed up, Martin Fry of ABC was sitting there waiting for me. And they had hired a keyboard player — they felt it was their responsibility. Over here, a keyboard player brings his own gear, while in the States, the guys walk in with a little black briefcase expecting you to sort out the keyboards.

"In the U.S., most mixes come from the record company, while over here, most come from the artist's management. And I prefer it from the management for the simple reason that they know much better what they want. They want Bruce Forest to re-

mix their artists' record. But when a record company calls and says they want you to do so-and-so, the chances are that they're just jumping on a bandwagon, not necessarily who's best suited to re-mix a particular track. "When it comes to management, they will always pick someone they feel is best for the job. In the U.S., it's rare to meet the artist, but here it's more common. They can set up a meeting and I can meet the guy and talk about the track. "I had a very nervous moment in Amsterdam. I was at a convention and a voice came over the public address: 'Would Bruce Forest please go to the organizer's office?' They said I had to call MPL [McCartney's management] immediately. And I thought, 'It's a Sunday, why else would he track me down in Amsterdam on a Sunday unless he hated it?' It turned out they were calling to say they needed a 7-inch right away. But I had a nervous 10 minutes!" ■

THE GREENING of the Studio

A group of Los Angeles-based producers has sent a letter to Los Angeles studios asking them to help preserve the environment by not using styrofoam products, such as to-go containers and beverage cups, in their studios. The letter was signed by Rick Nowells, Jimmy Iovine, Shelly Yakus, Jellybean Benitez, Belinda Carlisle, Billy Steinberg, Desmond Child, Davitt Sigerson, Don Was and Maria Vidal, and it read:

"Dear Studio Manager:

Please join us in our efforts to save the environment! One way that you can help is to stop using styrofoam products in your recording studio. We hope that you will read the attached article, copy it and distribute it to your friends. Thank you for your help in this fight to save our world."

According to Laura Harding, Nowells' assistant, the response from Los Angeles studios has been very good. The group is also encouraging producers and other studio personnel in other cities to send a similar letter in their area.

For more information or a copy of the article mentioned in the letter, contact Nowells' office at 213-655-7990; fax 213-655-0926.

TrendWatch

Items of interest from outside the pro audio industry:

CD Reissues: Engineer Roy Halee, who remastered Simon & Garfunkle's "Collected Works" CD box, complained about the quality of the original CD issue of "Wednesday Morning, 3 A.M.," calling it a "hopeless mess." Quoted in the International CD Exchange, Halee said that his remastering of "Wednesday Morning" was an improvement but still contained a "horrendous amount" of distortion. Halee initially alleged that CBS lost the original masters and used third- and fourth-generation tapes. CBS denied that, saying that although they did have the master tapes, it wasn't worth the time or money to use them for remastering.

Lawsuits: A man who broke his kneecap at a Rod Stewart concert contended that the house system contributed to his accident, according to UPI. The lawsuit, which was filed against Stewart, the Cajundome, Lafayette, LA, and its insurance company, states that the music was "en-

hanced by sound amplifying devices so as to propel and propulse in all directions a highly intensified conglomerate musical sound typically identified as hard rock" This, with the lighting system and lyrics, led fans "into a boiling pot of ecstatic emotionalism." The man broke his knee when he slipped on liquid near the front of the auditorium.

Legislation: The DAT bill, which would require consumer DAT machines to incorporate the SCMS anti-copying system, is slowly making its way through Congress after an early March introduction. A hearing before the Senate Communications Subcommittee was scheduled for June 13. There has been no word on when the House Commerce, Consumer Protection and Competitiveness Subcommittee would hold its own hearing. On the censorship front, 13 states have withdrawn record-labeling legislation after the Recording Industry Association of America said it would standardize a label for its member companies. There are bills that are still active in about five states.

"Americans tend to walk into a studio as if it were a temple. They're reverent about the equipment there. The British walk in and all they see is potential; they'll see a piece of equipment that's supposed to be used for a vocal effect and use it on a guitar. I think it goes back to the European tradition of decadence. The British tend to be somewhat kinky. During the day, they walk around in bowler hats and umbrellas, and at night they go home and spank each other. It makes for interesting records.

— Billy Joel, as quoted in the *Chicago Tribune*.

Crystal Sound/New York	New equipment: Akai S950, Neumann U-47, 386 PC computer.
Editel NY/New York	Donald J. Cuminala named chief engineer.
Red Rock Recording/Saylorsburg, PA	Installed East Coast's first Amek Magnum console.
Selcer Sound/Brighton, MA	New studio venture with Brian Capouch — Soundworks.
Soundtrack/New York	Added Sony PCM-3348 DASH recorder.
Studio 4/Philadelphia	B Room update: SSI EG console, Westlake BBSM-15 monitors, variety of outboard gear.
SOUTHEAST	
Allied Film & Video/Orlando, FL	Relocated Florida operations to 4364 35th St., Orlando, FL 32811; 407-649-0008; fax 407-295-1840.
Atlantic Video/Alexandria, VA	William A. Winn named audio engineer.
Clifty Studios/Paris, TN	Upgraded to A-DAM 36-track
Soundscape Studios/Atlanta	New equipment: Genelec 1035A monitors, Studer Editech Dyaxis, Otari MTR 90.
MIDWEST	
Ajax Recording Team/Fort Wayne, IN	New outboard equipment: Eventide H3000B/SE, Drawmer 1960, DS-201 gates, Dolby SR, Neve 1089 mic/EQ modules.
Paisley Park Studios/Minneapolis	Tom Tucker named chief recording engineer.
Smith/Lee Productions/St. Louis	Steve Higdon named chief music engineer.
Sound Decisions/Bolingbrook, IL	New name of Body Electric Studios, reflecting new direction of audio for corporations.
SoundStage 1/Galesburg, MI	New recording facility.
MOUNTAIN	
TeleScene/Salt Lake City	Completed 24-track audio studio and 16-track MIDI studio.
SOUTHERN CALIFORNIA	
California Magnetics/San Diego	Will install Magnefax 7-slave bin-loop duplication system.
Group IV Recording/Hollywood	Opened new Pablo Room for SFX and electronic music.
Intersound/Los Angeles	Celebrated 10th anniversary.
Soundworks West/West Hollywood	Acquired Odyssey Filmmakers assets and building adjacent to Soundworks West's facility.

News notes

Washington Professional Systems has opened a regional office in Mt. Laurel, NJ. The office is headed by Thomas Knauss, general manager, and will concentrate on the supply, installation and service of audio-visual systems. The office is located at 20000 Horizon Way, Suite 200, Mt. Laurel, NJ 08054; 609-273-8688; fax 609-273-8558.

Agfa presented its sales awards during a sales meeting in Breckenridge, CO. Bob Zamosciany, regional sales manager, Atlantic region, received the Vice President's Award. Jim Rouse, Pacific region, won first place in the sales contest. Second and third place went to Mike Caputo and Bill Greene, both from the Atlantic region. The Outstanding Performance Award was presented to Wayne Desmond, technical support engineer, Ridgefield Park.

Sam Ash has opened a store dedicated to sound reinforcement, DJ equipment and club lighting. Managed by Tom Dubas, the store is located at 166 W. 48th St. in New York.

During its 24th annual awards dinner dance, the **Cinema Audio Society (CAS)** honored mixers who were recipients of the Emmy Awards and Oscar nominations. The Man-of-the-Year award went to Bill Varney, vice president of sound at Universal Studios. Special awards of appreciation were given to Fred Ginsburg, Ed Somers and Phil Silvers for their successful efforts in producing the wireless mic symposium held last summer.

JBL has presented West L.A. Music with the first annual James B. Lansing Sound System of the Year award. The award is in recognition of a complete concert sound system delivered to Los Bukis in Mexico.

First Choice Marketing is a new marketing firm serving broadcast, commercial and pro audio manufacturers in the northwest United States. The firm is located at 7355 50th Ave. N.E., Seattle, WA 98115; 206-524-7344; fax 206-524-1015.

Nagra USA has added two new customer service options: product leasing and service contracts. Leases can run

from one to five years, with an option to buy at termination or to upgrade to newer Nagra technology. The service contract option covers the cost of labor for any equipment needing repair after the automatic 1-year warranty expires.

Distribution news

Alpha Audio's acoustics division is the new distributor for the Azonic line of acoustical foam products.

Klark-Teknik has been named the exclusive U.S. distributor of Milab's product line.

Neve North America and **Orion Research** have signed an exclusive agreement making Neve responsible for the manufacturing, worldwide sales and service of the Orion line of broadcast audio consoles.

Dealer news

Pyramid Audio (Chicago), **Martin Audio** (New York) and **Hy James** (Detroit) have been named dealers for the Digital Dynamics ProDisk-464 line of digital audio recording and editing systems.

Hybrid Arts has appointed **SG Audio** (Chicago) and **Milam Audio** (Pekin, IL) as authorized dealers of its ADAP II digital audio recording and editor.

Rep news

Twenty-two sales reps from the United States and Canada attended **Rane's** first training session, held March 9-10.

Tascam has presented New York-based **Marketration** with its Rep of the Year award.

Address changes

Hybrid Arts has relocated to 8522 National Blvd., Los Angeles, CA 90232; 213-841-0340; fax 213-841-0348.

Neve North America has relocated its headquarters to 7 Parklawn Drive, Bethel, CT 06801. The phone and fax numbers remain the same. ■

STUDIO UPDATE

Facility/Location	Details
NORTHERN CALIFORNIA	
Davis Sound/Davis	New equipment: Dolby model 363 2-channel SR noise reduction unit for its Otari 1/2-track machine.
Mobius Music/San Francisco	Addition of Neve/Studer room: Neve 8068 console and Studer A820 2-track.
Music Annex/San Francisco	Completed its Studio III audio for video mixing suite with an AMEK 2500 console and Otari tape machines.
Sound Recording Organization (SRO)/San Francisco	Joined Music Annex at the 69 Green St. facility in San Francisco.
Thumper Sound Studios/Oakland	New recording facility offering 16-track recording with automation. Box 520, 1001 Bridgeway, Sausalito, CA 94965; 415-547-3402.
NORTHWEST	
Klub Kev's/Seattle	Retrofitted Neve 8232 console for installation of Digital Creations Disc Mix moving fader automation system.
HAWAII	
Lahaina Sound/Maui	New equipment: Lexicon 480-L, TC Electronics TC 2290 delay-sampler, Yamaha SFX 1000, Digitech DSP 256 multi-FX, two Lexicon PCM 42 delay lines, two Lang PEQ-2 EQs, Yamaha C300 recorder and Sony PCM 2500 pro-DAT. Upgrade: Sony DASH chips for PCM 3324.
DEALERS	
Gand Pro Audio/Chicago	Named Meyer HD-1 dealer. Has installed Otari multitrack recorders at Solid Sound Studios, Joy Art and Chicago Rehearsal Studios; a Roland R-880 reverb to Nexxus Recording, Waukesha, WI; and a Tascam M208 console, two Otari 5050 BIIIs, an Otari MX50 and dbx 263x, 163x and 463x units to Sound/Video Impressions, Des Plaines, IL.
Redwood Marketing/Nashville, Los Angeles	First sales of AMEK Classic mixing consoles: Turner Broadcasting, Atlanta; ABC, New York; NBC, Burbank.
MANUFACTURERS	
Neve	Installations: VR72 console, Chicago Recording Company; Flying Faders, Groundstar Studio; two V60 consoles and an 8128, Devonshire Audio & Video.
Soundcraft	Installation: two Delta consoles, Eel Pie Studios.
Sony Pro Audio	Sales: PCM-3402 DASH recorder, Jack's Tracks Recording Studios; PCM-3348 48-track DASH machine, Digital Recorders.
BrystonVermont	Sales: 13 3B amps, four 4B amps and three 10B electronic crossovers, Pacific Sound Services.

Fresh Tracks

Steve Morse: "High Tension Wires"

Label: MCA
Producer: Steve Morse
Recorded by: Steve Morse, Tom Wright, Rick Sandidge
Mixed by: Steve Morse, Rick Sandidge
Studios: MOR Studio, Atlanta; Chesire Sound, Atlanta; Mark V/Soundcastle, Greenville, SC
Mastered by: Glenn Meadows at Masterfonics, Nashville
SPARS Code: AAD

Comments: This is a truly excellent, tasty solo album. Instantly accessible, the music ranges from country funk romps to full-tilt electric fusion, from new age-inspired excursions to acoustic/electric folk pilgrimages.

Of special interest: Listen closely to "Highland Wedding," "The Road Home" and the direct-to-digital master "Tumeni Notes," the latter a direct stereo guitar cut. ■

Fresh Tracks is a monthly department spotlighting recent album releases from a technical and production viewpoint. R•E•P is pleased to recommend these releases, both for quality referencing and listening enjoyment.

Eric Johnson: "Ah Via Musicom"

Label: Capital
Producer: Eric Johnson
Recorded by: Richard Mullen
Assisted by: Eric Johnson, Chet Himes, Bob Lacivita, Walter New, Dave Parks, Stuart Sullivan
Recorded at: Riverside Sound; Saucer One Studio; Arlyn Studios; Studio Seven (all in Austin, TX)
Mixed by: Michael Frondelli, Richard Mullen
Mixed at: Soundcastle Studios, Los Angeles; Riverside Sound, Austin
Mastered by: Bernie Grundman at Bernie Grundman Mastering, Hollywood
SPARS Code: Not listed

Comments: Succinctly arranged and produced, this 3-piece (plus occasional synth) rock romp is an encyclopedia of guitar sounds, ranging from Hendrix and the best full-attack jazz-rock fusion of the Seventies to some of the sweetest, cleanest acoustic sounds ever.

Of special interest: Listen to "Desert Rose" for the digital effects, masterfully layered guitars, drum punch and imaging. This is a tune to calibrate your ears with. Also listen to the tones and mix of "Steve's Boogie," a country-flavored rocker, and "Trademark," a snapshot of Johnson's patented guitar virtuosity at its best. ■

Vonda Shepard: "Vonda Shepard"

Produced by: Vonda Shepard, James Newton Howard, Robert Kraft, Gardner Cole and Art Munson

Executive Producer: Felix Chamberlain
Studios: Oceanway, Kren, Leeds Le Mobile, Can Am Recorders, The Complex, Studio 55, Circle Seven, Sunset Sound, Art Munson Studios, Garden Rake Studios, Skyline Studios, Schnee Studios

Engineers: Ed Thacker, Greg Ladanyi, David Pack, Ross Pallone, Brian Malouf, Art Munson and Ian Eales

Mastered by: Stephen Marcussen at Precision Lacquer Mastering

Comments: Mainstream pop artists, who often draw from different styles, can present interesting challenges in recording and mixing. This album shows what a sympathetic engineering and production team can accomplish.

Of special interest: "Don't Cry Ilene" features mic and instrument selection not typically associated with today's production standards. Mix influences from Toto and the Yellowjackets result in an airy and sonically compelling sound. ■

RELIABLE PLAYERS

CRYSTAL TALIEFERO ON QSC.

I always work with the best.
Billy Joel, John Mellencamp, Bob Seger,

Fresh Tracks

Luciano Pavarotti: "Tutto Pavarotti"

Engineer: Not listed
Producer: Not listed
SPARS CODE: ADD and DDD

Comments: This double-CD collection is noteworthy for the inclusion of opposing recording and production techniques: analog vs. digital recording, and a full orchestra vs. a MIDI one. Here is the perfect demonstration disk for analog purists and digital perfectionists alike.

Of special interest: "Caruso," by Lucia Dalla, featured in the movie "The Fortunate Pilgrim," features a MIDI orchestral arrangement. The vocal processing, with artificial reverberation, dynamic expansion and digital delay, is most uncharacteristic for a classical artist of Pavarotti's stature. ■

Dick Hyman: "Dick Hyman Plays Fats Waller"

Label: Reference Recordings
Produced by: J. Tamblin Henderson Jr.
Executive producer: Marcia Martin
Recorded by: Keith O. Johnson
Recorded at: Evan Williams Recording Studios, Santa Ana, CA
Mastered by: Robert Harley, assisted by Beck Rowel and Steve Rickmon
SPARS code: D

Comments: Touted as the world's first direct-to-CD recording, these performances were first encoded and edited on a Bosendorfer 225SE Reproducing Piano. Later, they were transmitted via microwave to the mastering house, where glass masters were created in real time. The session's participants cited the disk's superior sound quality as worth the expense and time.

Of special interest: Although the process may seem overly cumbersome, the recording's strength is in the clean presentation of Hyman's performances on such standards as "Ain't Misbehavin'" and "Honeysuckle Rose." Is there an audible improvement? You be the judge. ■

Zil: "Zil"

Label: Verve/Forecast/Polygram
Executive producer: Joao Mario Linhares
Produced by: Joao Batista, Ze Nogueira and Zil
Engineered by: Sergio Murillo, Mario Jorge, Zezinho Almeida, Marcio Menescal and Helcio Braga
Mixed by: Sergio Murillo
Mastered by: Dennis Bouch at Future Disc Systems, Hollywood
Studio: Synth Studios, Rio de Janeiro
SPARS Code: Not listed

Comments: Comprised of seven of Brazil's top musicians, Zil combines Brazilian, pop and jazz influences for an effective presentation. A straightforward production, the album's use of panning and effects are tasteful, yet effective.

Of special interest: "Song for the Rainforest" and "Zarabatana" both for their effective placement of vocals. ■

The Perfect Mix:

John Hiatt—Performer,
Songwriter, Producer, AMR
Production Series™ 1600
Console Owner.

PEAVEY
AUDIO MEDIA RESEARCH™

PRODUCTION SERIES
1600

Through continuing contact with professional recording engineers, Peavey Audio Media Research has produced the definitive mixing console with performance, function and features of uncompromising quality. Ask John Hiatt—performer, songwriter, producer—what he thinks of his new Production Series™ 1600 from AMR. Like John, the kind of people that incorporate AMR equipment into their studio design usually have quite a track record of success. Whether you're a seasoned professional or a talented novice, AMR has the right equipment for you.

Digital Domain

Technology for Today

By Rick Schwartz

Welcome to Digital Domain. Don't be misled by the high-tech title. The last thing you'll find here is speculation and buzz words like virtual and Hypermedia.

Although we could write about future technologies that may someday change our lives, most of us are more concerned with next week than next year. By necessity. After all, we need solutions to the problems facing us today. Problems like synchronization, interconnectivity and the lack of standardizations.

What we need is concise information

Rich Schwartz is a sound designer/engineer and director of post-production for Music Animals, Los Angeles.

about what is currently available and what will be available in the future. We also need to make educated decisions about the directions that technology is taking: Are optical disks cost effective, compared to regular old-fashioned magnetic hard disks? Does 18-bit really make a difference you can hear? Should I buy a workstation now or wait until later? Digital Domain is here to help you wade through the swelling waters of technology and answer these questions.

There are many exciting products and technologies available today that are not widely used. Satellite technology, for example. Did you know that your studio can transmit and receive real-time audio to studios all over the world at a reasonable cost? This "dial-up" capability is going to change the way many of us work.

Another exciting topic we will cover is the integration of technologies: the combination of computers, optical technology, MIDI and digital audio in creative new

ways. Companies such as DigiDesign, Opcode, Lone Wolf and Studer Editech are developing products addressing these things even as we speak.

From time to time, I enjoy going back and looking through my old audio magazines. Some articles are still timely, others not, but my favorites are columns that made predictions about the future. Why? Because quite often they were wrong. So many new products that were expectantly heralded in those publications never made it to market.

Sometimes writers in audio magazines have a tendency to water down their columns so they do not offend anyone. After all, most publications are driven by revenue from advertisements. Even worse, these writers do not seem to spend much time with a product before the review goes to print. In extreme cases, I find myself wondering if the author even used the product. So many pieces seem as if the writer merely rewrote the owners manual, throwing in comments about how nice or useful he or she thinks a feature might be. Yes, but did it work? There is nothing more frustrating than purchasing a new piece of software or hardware that has received a glowing review and finding out it's buggier than a woodpile. With the subjects we cover and the products we review, that won't happen here. Promise.

So what kind of people should read this column? Anyone whose livelihood is determined by their awareness of modern production techniques and equipment. In fact, anyone who uses their ears to earn a living. This includes music mixers, audio for video mixers, mastering engineers, film sound editors, audio consultants and designers. Most of you own or use a computer. Many of you come in contact with MIDI on a regular basis. Most of you will be working with digital recording, whether it is a keyboard sampler, a piece of processing gear in a rack, a digital tape recorder or a hard-disk workstation.

Instead of sticking with rigid structures, Digital Domain will incorporate various formats, including product reviews, conversations with industry heavyweights, and, of course, we will emphasize leading edge technology.

Expect to learn about great and powerful undocumented features for the products that you own. Plan to discover helpful tips and assistance on subjects like SMPTE timecode manipulation, MIDI, the interface of audio equipment and computers.

DIGITALLY CONTROLLED

WITH WHITE INSTRUMENTS PERFORMANCE

1/3 OCTAVE EQUALIZER

WHITE instruments Model 4700/4700-2 One or Two Channels in One Rack Space

- 28 One-Third Octave Filters, 10dB Boost or Cut, 0.5 dB resolution
- Adjustable High and Low Pass Filters
- Adjustable Gain in 0.5 dB steps
- All Functions Digitally Controlled
- Ten Non-Volatile, User Programmable Memories, No Battery backup
- Ten User Programmable Presets
- with Optional Remote Control
- Intuitive Real-Time Controls
- Tamper-Proof with Password Security
- Servo-Balanced, Differential, I/O
- Output Muting during Power up/down
- Hard-Wired By Pass Switch
- Optional RS232 and EIA422 interfaces
- Affordable Price

If you think this looks good,
wait until you hear it.

Circle (11) on Rapid Facts Card

We could go the traditional way and tell you a load of "spec" But, to really appreciate the new Ramsa 500 Series Speaker System you have to *hear* it. To find out where you can hear it, call 714-373-7278, or write to Ramsa, 6550 Katella Avenue, Cypress, CA 90630.

Every sound engineer needs a silent partner.

An investment in a recording console represents a partnership you plan to live with for some time. Which is why the Sony MXP-3000 series console is a sound business decision.

Its design concept is based extensively on sonic performance. Boasting features such as low-noise hybrid amplifiers, gold-plated connectors and large crystal oxygen-free interconnect cables that produce unparalleled sound quality. These ingenious features tell the inside story as to why this console is so quiet. And countless installations tell the outside story as to why this console is so successful.

Of course, sonic performance isn't the only story behind our console. Flexibility is a necessity in the creative recording process, as well. Naturally, the MXP-3000 offers a host of flexible features at an unmatched value.

For instance, you have your choice of five distinct equalizers, and five different channel input modules. Plus, there are many other options available to suit your individual needs. All of which come housed in an ergonomically designed control surface.

For a demonstration of the quietest addition to your control room, contact your Sony Professional Audio representative. Or call 1-800-635-SONY.

And remember, when you want a quiet mixer to back you, put a Sony MXP-3000 in front of you.

The Best of Both Worlds

By Pete Caldwell

Digital audio has been a major issue in this industry for awhile now, but what are its advantages? The obvious answer is that digital audio often sounds better than analog. Why? Because digital systems, by nature, are freed from much of the noise to which analog systems are inherently chained.

Additionally, digital recordings do not manifest distortion, wow, flutter, loss of frequency response and other anomalies found in analog recordings that have passed through many generations from original recording to final product.

This is fine as technology goes, but unfortunately, it is an oversimplification of life in the real world. To better appreciate life in the everyday trenches of the audio industry, let's consider three primary realities we must all face.

Reality No. 1: In a professional recording studio, first-generation analog recordings can be mighty good. (There are those who think that first generation analog sounds better than digital, which has its own unique anomalies such as aliasing and rounding-off.) At Doppler Studios, we once placed a \$180,000 digital multitrack on one side of the control room and a \$60,000 analog multitrack on the other side for a simultaneous recording comparison. We hired a rhythm section and recorded everything from heavy metal to Chopin. The results of subjective listening tests by many of Atlanta's best audio engineers were quite interesting.

Both recordings were very good. I felt that the digital was a bit quieter with a truer bass response, but the extreme high end seemed somewhat harsh. The analog high end seemed warmer and more pleasant, and the anomalies in the bass could be adjusted easily with equalization. The addition of noise reduction to the analog process placed the apparent noise levels of the two recordings in a similar range.

There are those who say that they can hear unpleasant artifacts from noise reduc-

tion systems, but in general, professional quality, state-of-the-art, first-generation analog recordings are pretty damned competitive with digital recordings. The fact remains that digital will hold up better than analog through successive generations. This brings us to the second reality in our real world scenario.

Reality No. 2: In the present world of sound recording for film and videotape, the end product is most often going to be analog. Programs and commercials will go to the TV broadcasters on 1-inch Type C tape, because most stations do not yet have D-2 digital VTRs. Audio will probably go to the film mixer on sprocketed analog mag film.

Unfortunately for digital, it is the end use playback that is most important. Your CDs at home sound great because you have a digital player. A \$300 CD player can take advantage of all of the beauty of a digital recording, while a \$300 audio cassette player can butcher the beauty of any recording. Digital is great if your final product is a CD.

Studios must make thoughtful, informed choices in order to get the most from analog and digital.

So why use digital if the advantages are going to be largely lost? Well, there are several reasons. If you have multiple layers or a very complex combination of components, and if you can keep your audio in the digital domain all the way to the last or next to the last step, then the results will be better: quieter, clearer and more faithful to the original, even if the end product is analog. But digital recording can be expensive, and in some cases it is difficult to manipulate easily in the production process.

It has become the responsibility of today's recording studio to help audio producers decide when the added cost is worth it. In short, audio producers must know in advance how much difference digital recording will make. With the help of the studio, they must then plan the complete audio process to avoid bouncing back and forth from digital to analog.

Reality No. 3: There is a lot of digital hardware in the real world right now. In many cases these various machines and formats will not easily interface with one another. They do not talk to each other without involving manipulations. Therefore, it is the further responsibility of today's recording studio to insure, at the beginning of a project, that all of the facilities involved are comfortable with the various digital formats to be used.

In sound recording for film and videotape, the end product is most often going to be analog.

For example, there are two entirely different digital multitrack formats. There are many different stereo digital formats. Different devices employ different sampling rates. Digital editing systems and workstations are notoriously unfriendly to each other.

Analog, on the other hand, has been around long enough to evolve standard formats and conventions. As we all know, there are always unforeseen traps. But compared to digital, analog is a calm and well-traveled sea upon which to sail. Digital interfaces can be tempestuous crossings.

Am I suggesting that we dispense with digital? Of course not. Digital is clearly the wave of the future. Digital is coming on strong, but some problems are coming with it. Analog, too, has a long and busy future. The studio of today must make thoughtful, informed choices to get the most from both real worlds. We must understand the present complexities and help guide our industry along safe, efficient, good-sounding paths.

The studio of the future will be all digital. The studio of the present must live with the best of both worlds. ■

**THE R·E·P
INTERVIEW:**

Hugh Padgham

By Richard Buskin

“I’d rather have a bad-sounding record that’s got a good vibe and is a good song, than a bad song that sounds fantastic,” asserts Hugh Padgham. “Sometimes you get demos that sound fantastic, and when you go into the studio and try to re-create them, everything’s clean and nice, and it doesn’t sound as good as the demo.

“There are times when dodgy equipment can be nice, and I use quite a lot of cheap equipment — even some semi-pro stuff — and people come in and say, ‘Wow, do you use that? I’ve got one of those in my home studio!’”

The above statement notwithstanding, Padgham is not averse to employing state-of-the-art technology in order to create a sophisticated

Richard Buskin is a London-based free-lance writer.

**The Grammy-winning engineer/producer
talks about his work
with Phil Collins, Genesis and Suzanne Vega.**

sound on the records that he is producing, but whether he has been recording David Bowie's "Tonight," Paul McCartney's "Press to Play," the Police's "Ghost in the Machine" and Grammy award-winning "Synchronicity," Genesis' last two albums or each of the solo projects by Phil Collins, he has always essayed to keep the sound fresh and uncluttered, encouraging the listener to pay attention to the music rather than the machinery.

Hugh first met Collins while engineering Peter Gabriel's album, "The Third," at London's Townhouse Studios in 1979. He had started out a few years earlier as an assist engineer and tape-op at the nearby Advision and Lansdowne studios. Prior to embarking on a five-month tour of Europe with the Jim Capaldi Band, Padgham joined Townhouse as an engineer. Soon after, he helped wire in the first SSL desk to be installed in a commercial studio in the U.K.

Gaining experience with PIL, the Jam, XTC and Spandau Ballet, he moved on to production with Collins' "Face Value" album in 1981, went freelance, recruited the management services of Dennis Muirhead and has never looked back.

Aside from producing, he has mixed records by Brian Wilson, Genesis, Hall & Oates, Youssou N'Dour, Suzanne Vega and Sting. His track record places him in the top echelon of contemporary record producers and engineers. This has been duly acknowledged with a number of top awards, including the Grammy for Producer of the Year in 1985. He is scheduled to work on the new Sting album later this year.

In the interview, Padgham talked about Collins' latest album, "...But Seriously," the mix of Suzanne Vega's new record, "Days of Open Hand," and using new technology.

Working with Phil Collins

"Whereas Phil always comes into the studio on the first day with a pile of demos, the last two Genesis albums have started with absolutely nothing prepared. The band just jams in the studio for a couple of weeks. I record everything, ideas build and the songs come out of this.

"With Genesis, Phil sets up with a mic, sings 'la-dee-da-dee-da' or whatever comes into his head, and just uses drum machines. Drums only get recorded once a drum machine pattern and a framework of the song is on tape, and then the drums are just like any other overdub.

"With Phil's latest album, on the other hand, he came in with 8-track demos and did everything through his sequencer on the Emulator and drum machines, and used an SBX 80 sync box. In the old days, before sync boxes, in order not to lose the original feel of the demo, we actually dubbed the 8-track stuff onto 24-track and

then carried on overdubbing from there, putting real drums on, real bass, real vocals. But the drum machine on records such as "In the Air Tonight" and the Prophet pad was all actually original 8-track material.

"I suppose I have more music input on the Phil record, because when it comes to guitars and bases, Phil hands the onus over to me. He admits he isn't expert in guitar parts and that sort of thing, so we get good musicians in and I help direct them. For instance, Phil hasn't necessarily written a bass line to the tune, so the bass player will come in and start playing along and I'll tape him and tell him the parts that I like and so on. Recording like that is great fun.

"For the first two weeks we'll put down the stuff from the demo or re-create the programs. We started the tracks with a variety of drum machines, but we mainly used the old [Roland] 808, which is MIDI-modified so that we can drive it off the SBX 80. We also plugged up the basic keyboard parts that would be in a sequence in an E3, hit 'play' and let that go. Then there would be other parts that he'd done manually that we would put down before going on to the next song.

"Then, before we had anyone else in, we'd put down a guide vocal and a track of real drums, before which all of the bass and guitar parts would be recorded and amendments made — where necessary — to keyboards or drums or whatever. One of the beauties of Phil's records, his keyboard parts and his tunes, is that they're so simple. It's really hard to write simple material, and in many cases, we try to keep the production pretty bare as well.

"About six or seven times out of ten, what we call the 'rough drums' will end up being the drum track, because I get his sound while he's running it through a couple of times and then he just plays it. So doing a drum track, especially because he's such a brilliant drummer, is a half-hour operation at most.

"We have created a drum sound by way of the fact that we used to do most of his recordings in Studio 2 at the Townhouse, which has a distinctive sound to it. When we originally built Genesis Farm 10 years ago, we built a stone room to reproduce the same kind of sound down there; they're stone rooms, not wood rooms or glass rooms, and that accounts largely for the live sound, but then there's the way Phil tunes his top toms very tight, and they're single-headed.

"We always call them the 'barking toms'

because they bark when he hits them! I don't know many other drummers who have toms that sound like that. He also uses a smaller bass drum than other people use, while his last rack tom — the one nearest the floor toms — is bigger than other people's.

"I usually mic the bass drum with a Neumann U47 — I like the fatness, the low-end thud that those mics give — a good old [Shure SM-] 57 on the snare, 57s or [Sennheiser] 421s on the toms, condenser or ribbon mics on the cymbals, and usually a pair of [Neumann U-] 87s for room mics. Then, with Phil, I also like using the [AKG] 451 on the hi-hat, because he's got tom-toms and cymbals and stands everywhere, so sometimes you choose a mic because you can get it into where you want it to be! So basically I think careful placement of the mics on the drums and a good recording, and you can't go wrong.

"For recording voices, we generally use quite an unusual technique, which consists of singing through a dynamic mic — a regular Beyer M88, which he uses on stage — then going through this old Allen & Heath mini-limiter. It has got a few controls on it for fast attack and slow release and things like that, and I plug that over his voice and it's as noisy as hell! Dynamic mics are a bit noisier than condensers anyway, so you're dealing against the odds as far as noise is concerned, but it doesn't actually matter. I've got it down pat now.

"[The A&H] is a fantastic limiter, especially for me being co-producer with him, because when he's singing, I'm the only one in the control room talking to him about this performance, suggesting improvements and giving encouragement. You set a level for it and it's like the VU meter needle hits a brick wall, but it very rarely sounds over-limited. So when I'm doing vocals, I don't have to worry about the engineering side at all.

"The way we work is that Phil will usually rehearse his part twice, then we'll record him singing it four times. The first one we always call 'The Bridesmaid,' because nine times out of ten, it's compiled from takes two, three or four. He's good and sings pretty quickly. Although we sometimes drop-in, I try to avoid doing so, because if it's a song with a fairly gentle verse and a lot of shouting at the end, the voice will invariably sound different if he then has to go back to redo a line in the verse!

"On most of the other albums, there was usually a bit of [Eventide] Harmonizer —

Engineered For Those With A Passion For Performance.

200 Delta. From the smooth contours of its sleekly styled shell to the advanced circuitry that delivers unprecedented performance, Delta is the compact console of the nineties. Expanding on the modular versatility of its 200 Series predecessors, Delta incorporates many innovations unique to Soundcraft. Advances in low profile console design that go well beyond the obvious restyling.

Delta delivers superb sonic quality, with an improved electronic design that incorporates a new microphone preamp and active panpot. And, because Delta selectively bypasses any circuitry not in operation, you can be assured of optimum transparency.

Delta delivers unmatched versatility and control. With Standard, Deluxe, Stereo and Dual-Line Input Modules, Delta can meet a wider variety of applications. By adding up to four Group Modules, configuring just the right console for your application couldn't be easier.

200 Delta. Engineered for those who hunger for perfection.

New Deluxe Input Module includes expanded 4-band EQ with two mid-sweeps, high pass filter and post-fader direct output. The rackmount Delta, shown below in a 12x2 version using Deluxe Inputs, can be expanded to 24x2 using Dual Line Inputs. Both the streamlined consoles and rackmount models are built to withstand the demands of recording and sound reinforcement.

the same as Peter Gabriel, who would feel naked without it — but we didn't use any at all on this new record. I said, 'Phil, you've got a great voice, and although we've affected it a lot in the past, let's sing straight this time.' So, about the only treating we did to his voice on this record was tape-slap."

Choice of recording format

"On Phil's record, I recorded all the bass and drums on analog, using a Studer A800 with Dolby A. I did some A-B tests between a Sony 2500 DAT, a 1630, an ATR 100 with no noise reduction and an ATR 100 with Dolby SR. To me, the 1630 sounded like the most faithful reproduction. The analog without noise reduction also sounded good, in a punchy sort of way. I have mixed things that have been recorded SR that sounded very good, but I decided to steer clear of SR and go back to Dolby A.

"I did the drums and bass analog on Phil's record. For the rest, we started out using a Sony 3324. Then, by our good fortune, we were lent a 3348, so we converted 24 onto 48 and carried on from there. The 48-track is an absolutely brilliant machine to work on, if only for the fact that it has the most incredible transport.

"This 48-track was like a revelation, and I used it in an interesting way. I was determined, because of the size of the console, not to end up with more than I would have done if I'd been doing it normal 48 [2x24-track analog]. So I regarded the 48-track as two machines and I used channels 1-24 for information that I knew I was going to keep and use on the mix, and I used 25-48 as my drum and bass mix from the other tape as well as for stacking up vocals or keyboard parts; I used that as my slave reel, then bounced internally back over to 1-24 if needed. So I made sure I only ended up with, at most, 24 tracks of information on the mix."

Mixing Suzanne Vega's album

"I don't like the G-series EQ and I won't mix on one if I can possibly help it. I find it very annoying that I don't have the choice between bell and shelving on the top and low ends, and the two mid bands are absolutely vicious.

"When I was doing Suzanne's record, it was the first time I had worked at Skyline Studios [in New York] and I made sure that it was an E-Series desk. We booked the place and everything was fine. Then, after Christmas when I arrived there to start the work, I walked into the control room on the first day and sat down to write out the strip and I realized that most of the EQs on the desk were G-Series EQs! I freaked out — they had all been changed over to Gs — so we had to cannibalize whole channel strips out of an E-Series

desk that SSL had sitting in their warehouse in New York and put them into the Skyline console! I had discovered the problem at around 10 o'clock in the morning and by 3 o'clock we started mixing with the E-Series modules.

"I mixed that down to a 1630 with Apogee filters and we went down to Technics DAT, as well. That sounded great. The backing tracks had all been recorded at Skyline and the overdubs were done on an MTR 90 at Suzanne's house with a Demeter mic amp. It was all very well recorded.

"I've never been a particularly valve [tube] person, but I am going to start using Demeter mic amps. They're made in California and they are valve, but the specs on them are absolutely unbelievable — really low noise, very good technical specifications. Demeter also makes a valve DI box that everybody is raving about, so I've ordered some of those as well."

Mixing philosophy

"I don't like to spend more than a day on a mix. I like to get a mix to a stage that when I go home, I take a DAT home with me that I'm pretty happy with ... one that, if I died during that night, I wouldn't mind if it were released!

"I then listen to it in the morning on my own system, reconvene at around 10:30, iron out my thoughts with the artist, then lay down the final thing. Hopefully, a mix only takes a day, but it goes through a night so that you have eight hours or more off.

"I find it a really good challenge to mix other people's stuff, as long as there are not too many horrors on it. It's probably the most important part of the process, the part where you can make or break a record, because how you mix it is how Mr. Man-in-the-Street ends up hearing it.

"I'm happy to do two or three recording/producing projects a year, and four or five mixing projects. I do tend to look at it as two different jobs in a way, so it's great for me, because I don't get bored with either one."

Working with new equipment

"At the present time, I like to use Sony 48-track — while putting bass and drums on analog whenever possible — together with valve [tube] mic amps and compressors. In other words, going through some sort of valve-warming gear as it goes onto digital.

"One piece of equipment that I've recently tried out and really liked was a new Canadian device called Q-Sound, which Jimmy Iovine and Shelley Yakus have been involved with. If you're sitting in front of the speakers in the studio, you can control the direction of the sounds by way of a '3-dimensional' joystick. When I heard

the demo of it, the guitar solo came out and was sort of sitting on my ear!

"That was an extreme example, and while there is a danger that you can freak out on it, I hope I'm intelligent and aware enough to avoid doing so. When I use it, I aim to do so subtly and tastefully — there aren't going to be advertisements in the shop for this completely new recording medium — and I hope the music I record will just sound more interesting.

"For a live concert album, the Q-Sound would work great because it will give you clear imaging regarding the position of the musicians. But with a studio album, where do you put all of your overdubs if you're putting everything through it? So it's very interesting, and hopefully, I'll use it during the recording process as well, as opposed to just using it as a tool or toy during the mix."

Selected Discography

Produced and recorded:

- Phil Collins: "Face Value"; "Hello, I Must Be Going"; "No Jacket Required"; "...But Seriously."
- Genesis: "Genesis"; "Invisible Touch."
- The Police: "Synchronicity"; "Ghost In The Machine."
- David Bowie: "Tonight."
- Paul McCartney: "Press To Play."
- Paul Young: "Between Two Fires."
- XTC: "English Settlement."
- Human League: "Hysteria."
- The Fixx: "React."

Engineered and/or mixed:

- Genesis: "Abacab."
- Peter Gabriel: "The Third."
- XTC: "Drums And Wires"; "Black Sea."
- Brian Wilson: "Brian Wilson" (mixed 6 tracks).
- Sting: "...Nothing Like The Sun."
- Julia Fordham: "Julia Fordham."
- Suzanne Vega: "Days of Open Hand."

Awards

- Grammy Awards: Producer of the Year, Album of the Year (1985).
- Music Week Awards: Best British Producer (1985).
- BPI Awards: Best Producer nominations (1985 and 1986).
- Brit Awards: Best Single (1989) for "Another Day In Paradise."

Because compromise is out of the question

Whoever said, "compromise is the oil that lubricates the business process" apparently wasn't in the studio business. To the contrary, in this unique world where art and business meet, and clients expect the best, compromise may be the fastest way *not* to stay in business.

That's why Otari tape recorders come with something behind the meters.

Otari isn't in the toy business. The MX-80 and MTR-90 sport 2" thick cast alloy deck plates, heavy duty swing arms, and motor shafts designed to handle the exceptional acceleration characteristics of these machines.

Our MX-80 and MTR-90 multi-tracks are used all over the world to produce hit CDs and major motion picture sound tracks, and for good reasons.

For example, if you're involved in audio post, you'll appreciate a

capstan motor that is *designed* to be speed-slewed, plus external control connectors for easy interface to any SMPTE/EBU time-code based synchronizer, editor or machine controller.

For *whatever* you do in audio, both machines share constant tension transport technology for high performance, yet gentle tape handling. You'll also get digitally timed, gapless, seamless, punch-in, punch-out. On the "80," an autolocator with search zero and three cue memories comes built-in. And if you're a purist looking for the highest quality sound

Otari's proprietary integrated circuitry provides superior reliability and reduces service time.

possible, you'll appreciate the transformerless balanced inputs and outputs.

The MX-80 and MTR-90 were designed from the beginning to lock to external controllers, and therefore provide exceptional performance under these conditions. Pictured is the MTR-90's advanced EC-901 chase synchronizer.

And to keep everything where it belongs as you move from one studio to another, something else you have to look beneath the surface to see—a 2" thick, cast alloy deck plate.

It's not that we don't have our imitators. We do. But to coin an old phrase, beauty is more than skin deep. And someday when you're under pressure to get that track out, and you lock a "90" to your video machine and things happen exactly the way they should... Or some early morning after the talent has gone, you sit back and listen to what you've put together, you'll be glad you decided that "compromise is out of the question."

Call Otari. (415) 341-5900.

the making of...

“LAY YOUR HANDS ON ME”

By Tom Davis

The audio requirements for the Bon Jovi video required complex handling of several different sound sources.

“**H**e’s trying to break me, isn’t he? He was only teasing me with the last two videos, wasn’t he? Is this a trick question?”

That’s what I said to Curt Mavis and Jeff Richter of The Company when they started laying out the basic premise video director Wayne Isham was formulating for the Bon Jovi video, “Lay Your Hands on Me.” Wayne and I had done a number of music videos the last few years that were fairly involved on an audio level. But this was the first time he had come to me before the video was edited. Little did I know that they were deliberately easing the specifics of the job to me little by little to ensure my not taking my own life to get out of this one.

Tom Davis is an audio mixer at Post Logic, Hollywood.

The Company had been requested to create “the ultimate performance video” for Bon Jovi. But of course the label wanted to promote the pre-recorded version of the song, not a live performance. Nothing new here. I’m not the only one to take the record mix and add a little echo and crowd to match the picture.

But this was different. Wayne wanted to capture the entire gamut of a live concert. He wanted to condense the before-concert anticipation, the heat of a power-charged delivery, the audience participation and the finale, within the length of the song — about five minutes. When Curt and Wayne were discussing the approach to the clip with the band, he started playing with the idea of manipulating the front

end of the song to better suit the video’s needs.

For those of you not familiar with the song, it has an instrumental opening, basically 48 tracks and three minutes of craziness the band (and who knows who and what else) layed down when they were recording the album “New Jersey.” The final version for the record was cut down quite a bit, but we had dubs of the original 48-track analog tapes, so anything was possible at this point.

My involvement began one evening at Post Logic studios in Hollywood, where I met with Curt and Jeff to evaluate the 24-track master and slave of the song intro. Wayne wanted to see what we had on the individual tracks to edit and remix into an

Not your average woofer and tweeter.

Loudspeakers are wholly man-made devices. In the evolutionary calendar of man, the loudspeaker is just milliseconds old. By sheer ingenuity, man has refined a system which is capable of mimicking natural sounds.

The degree of realism, and hence the quality of natural reproduction, can simply be defined as **characteristics added** to the original sound. The quantification of these clues given to the human ear, decipher whether the sound is real

or reproduced by a loudspeaker on the end of an audio system.

The design and production of high quality loudspeakers is dependent on being able to measure, assess and therefore, rank and quantify these **added characteristics**. Having assessed the characteristics, the next and most important step is to select materials and techniques which will minimize or eliminate these

added characteristics altogether.

original rendition for the video. We set up in Studio C, which is equipped with a 32-input Neotek Elite console and an Adams-Smith 2600AV editor.

We proceeded with listening to groups of tracks a few at a time, first the master and then the slave, and made notes of what we found. The whole time, we were spinning an audiocassette and identifying with the console slate what tracks were up and at what time code, so that Wayne could go away with something to play with in his off-line bay. This took about four hours.

A few days later, we met in Post Logic's Studio B, which has a 48-input Solid State Logic 6000 console, an AV editor and Otari MTR-90 24-tracks with Dolby XP SR packs. After spending time with the sections of the track we were focusing on, it started to become apparent to me that mixing this stuff down to two tracks and doing the edits afterward was going to be rather tough. Certain tracks carried over each other and there was the possibility of cutting off chambers ringing over.

I decided to create a second generation Dolby SR 24-track edited submaster by patching the machines together track-to-track and assembling the selected sections on a pre-stripped time-coded reel using the Adams-Smith. (See Figure 1.) The beauty of this system is that you can do preview edits on any or all tracks of your record machine (by causing the MTR-90 to switch to input on record-selected tracks) and create a frame-accurate edit decision list, with full notes, to keep track of what is happening.

This was not just convenient, but necessary, because I had two 24-track playbacks (master and slave). While it was possible to synchronize four 24-tracks at Post Logic, it would get pretty unwieldy, not to mention expensive and confusing. So we pulled the pieces together, starting with the master, and edited it down to a fresh time-coded tape, sections at a time.

Editing track-to-track discretely like this enabled me to do the electronic version of a 24-track window edit, recording some tracks to one pass, delaying other tracks to accommodate parts ringing over, and to very easily slip individual tracks from one section to another section. It was like having an analog tape-based sequencer.

Once the master was cut to a length we liked, I put up another fresh tape to do the same thing with the slave reel. Using the edit list generated in the AV, I basically did an audio assemble, previewing each edit carefully and adjusting each edit for each specific track. The result was a new 48-track edited, unmixed submaster that had all the sections we wanted to time, ready

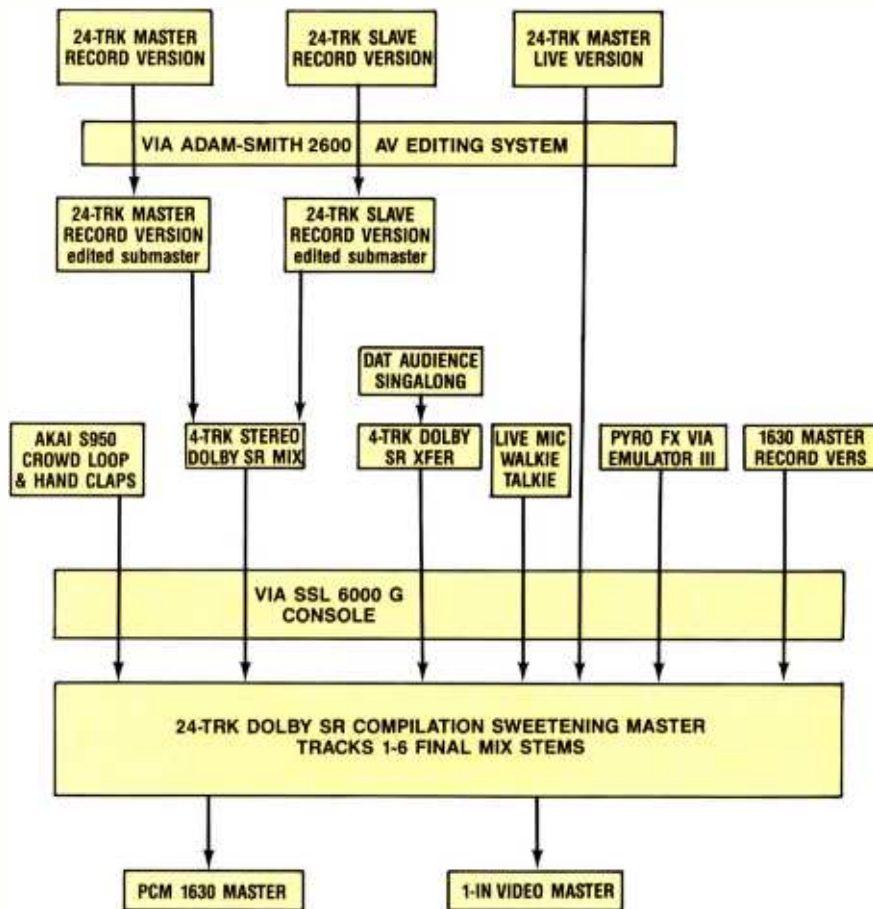

Figure 1. Flow chart of the audio assembly for the "Lay Your Hands On Me" video.

for an automated mix. After another 10 hours or so, we printed the mix down to a 30ips SR 4-track, taking the code across.

We now had the intro mixed, sans any crowd sweetening, for Wayne and Jeff to cut to. They took a 3/4-inch U-matic transfer of the final mix (which soon became a rough mix) and started a more defined edit using the punched-up parts in our mix to key off of, pulling the visual and the soundtrack together.

We then took a look at the middle section of the song, which was one of the little "specifics" they discretely waited for the right moment to surprise me with. The Company shot a live concert of Bon Jovi in Portland, OR, that had an a cappella singalong with Jon and the audience. Wayne wanted to open up the record mix and add the live tracks for the singalong. Well, not only did it sound very different, it was a whole step lower.

It was back to creating 24-track submasters again of the record version master and slave, and making mix moves to match the band breakdown to the way they do it live. We then added Jon's live vocal track, pitched up a whole step with an Eventide H-3000. To keep the whole thing moving along, we sampled the kick

drum part into an Akai S-950 and played it in the a cappella part. At the climax of the singalong, the full song kicks in and plays out to the finale.

At this point, we had a 30-second intro, with no crowd sounds, no complete song, a middle band breakdown with an added kick drum and a live Jon vocal with no singalong, crowd cheering or audience handclaps. All of this was plainly seen in the rough cut. It sounded pretty strange.

In the next session, we decided to mix the intro again, now that we had a better picture cut to work with. We did a Total Recall on the SSL and reset all the patches and outboard from paper notes and tweaked the mix for a few more hours. Mark Biehl and Tony Freedman, my assistants on the project, are famous for keeping impeccable recall notes, so the mix came back perfectly. We then did a remix of the center section as well, again down to a 4-track SR master, and put these tracks to bed.

The next step was to put all of these pieces together. This required going to yet another 24-track master to do a final conform, add crowd, pyro blasts and walkie talkie voices. Using the 3/4-inch off-line for reference, we layed over the intro mix

from the 4-track to the new 24-track, stretching the Dolbys for minimum signal degradation. At the point the song kicks in full, we layed in the PCM 1630 master of the record mix on another pair of tracks. At the middle section, we layed up our pre-mixed section, which had the band mix, the sampled kick drum and Jon's ad lib vocal, all matching to picture. After the middle section, we went back to the 1630 and played it out to the end. The music was now all in place.

On to the crowd sweetening. I usually find that two or three crowd loops of different intensity are necessary to give the range of control needed to avoid the crowd sounding like it's just getting louder and softer. I've even added 10 or 15 people in the studio screaming and hollering on seven or eight tracks to put some random specific voices in a clip.

We didn't need to go that far on this one. Once the crowd loops were in place, we moved into the singalong. When Wayne and Curt filmed the performance for the video, they asked the 600 or so invited guests to sing, a half-dozen times, the chorus, which consists of "lay your hands on me" three times. This was recorded on a portable DAT and transferred to 4-track SR to edit with. It sounded quite nice, but each phrase had to be placed individually to keep time. Plus, 600 voices don't sound like 10,000, so I double-tracked the whole mess and added *lots* of delay and echo.

But wait; they were rhythm clapping, too. Time to break out the Akai clapping disk that I had Paul Robie, one of my engineers, build for me. We called it up, picked the keys on the keyboard that seemed to feel right and played them in manually. I have to say I was real nervous about this section working, but it really did come out totally believable in the end.

On yet another session, Johann Langlie, a sound designer I work with quite often, came in to lay pyro blasts to the fireworks in the picture to create the ultimate climax. He packs an Emulator rack and an Apple Macintosh running the Digidesign Q-Sheet software to fire his sounds to SMPTE. After these were in, we wanted to put in some walkie talkie chatter at the top. We brought in a pair of walkie talkies and put one out in the studio with a mic on it. The other one was in the control room with us; we just watched the picture and squawked a few orders over the intro section.

With all these pieces in place, we attacked the final mix, blending the crowd swells in, adding some echo and slap to the body of the 1630 master version, balancing the singalong crowd and hand claps, and, last but not least, going completely over the top with the impact of the

pyro blasts. This mix was done twice on two different days to get it just right. The mix was automated down to a set of open tracks on the same 24-track, and layed up to a new 1630 master, as well as layed back to the 1-inch edited master in Dolby A.

I've done some pretty complex sessions in my 12 years of mixing for picture, but I think this was one of the most taxing on a purely logistical level. I'm not really sure how I would have gone about it had I not had systems like the Adams-Smith AV edi-

tor, an SSL desk and the excellent facilities at Post Logic. The audio portion of this video took about 90 hours, but it could have easily taken 150 hours or more without the technology I had at my disposal.

My only concern now is, what are Wayne Isham, Jeff Richter and Curt Marvis conjuring up for the next one? ■

CHECK YOUR BALANCE.

Before you invest in a professional DAT recorder, check to see if it stacks up against the Sony PCM-2500:

- ✓ Records at 44.1kHz as well as 48kHz
- ✓ Has professional SDIF-2, AES/EBU and S/P DIF interfaces
- ✓ Has built-in error indicator
- ✓ Operates on 100/120/220/240V, 50/60Hz
- ✓ Is supplied with both wired and wireless remote control
- ✓ Can individually trim L/R analog input and output

If it's a Sony, you can check all of the above — which is what you'd expect from The Leader in Digital Audio™. For more information call 1-800-635-SONY.

PCM-2500

- Recording and erasure of Start ID, Skip ID and Program Number subcodes
- Two-hour recording time (with DT-120 Sony DAT cassette)
- Less than 0.005% Total Harmonic Distortion at +4dB
- Greater than 90dB dynamic range
- High-speed locate capability at 60 times normal playback speed

DEALING WITH DRUMS

By Mike Joseph

Photography by Kevin Anderson.

Rediscover the lost art of placing and miking acoustic drums.

In a world where an ever-growing percentage of professional, respected, working music creators can regularly chart tracks without seeing a real drum kit, it is imperative that we occasionally return to the roots of recording. Like a pendulum, the whims of music production techniques swing back and forth. Acoustic drums are making a comeback, and it is important that knowledge of the art of drum miking not be lost.

Some of the approaches and techniques may be obvious. Some may be new to you. Some may be merely refreshing, once known but long forgotten. None, however, are developed definitively: All pros need to add their own twists. There are no definitives.

Mike Joseph is technical editor of R•E•P.

The sound of the beat

With the possible exception of having to record a 60-piece orchestra under the apron of an opera house stage thrust, drums are probably the most interactive, affecting, least-controllable set of sources there may be. The ability to record drums properly separates the kids from the adults, the firsts from the seconds. The ability to capture the combination of sounds you want to capture, as separate from those you end up with, is even more a measure of success.

Drums, which are essentially devices using the oscillations of a stretched diaphragm over the mouth of a resonant tube to move air, are arguably the oldest musical instruments. From the concepts embodied in their development sprang the

seeds of all other instruments. Sounding boards, vibrating surfaces, the pursuit of different pitches in different registers, and acoustic amplification can all be traced from drums.

Drums are classic 3-piece Helmholtz resonators. One end oscillates, its period determined by size, mass and tautness. The shell determines the length and column of air contained, creating a resonant cavity. The mouth at the other end couples the air column to the outside world, its diameter also determining tuning. Change one variable and the others change.

Above the skin on the outside, sound dissipates quickly, as the initial attack wavefront rapidly expands. Inside the shell, many pressure modes and nulls ex-

THE MOST COST EFFECTIVE SYSTEM FOR PRODUCING TRUE AUDIOPHILE CASSETTES

THIS SYSTEM:

- occupies less than 3 sq. ft. floor space

ist. The excited, resonant air column generates the fundamental, which principally couples to the outside air through the mouth. The vibrating air mass inside the shell secondarily restimulates the head, causing sympathetic vibration and the creation of multiple harmonics, which radiate back through the skin.

The pureness of the tone and length of sustain is determined, among other things, by how closely the mechanical tuning of the skin matches the mechanical tuning of the shell system. A head set to one pitch on a shell that is tuned, by design, to another will decay rapidly and speak in several tongues. If the two are harmonically related, the tone will be pure and the sustain long.

Among the acoustic instrument family, it is percussion instruments alone which generate fundamental frequencies from 25Hz to 10kHz. The harmonics of a size go measurably past 30kHz.

The act of effectively recording drums to tape is complex and convoluted, involving the original sound, multisource interaction, the effect of room boundaries, microphone diaphragm size/location/positioning/distance, room surface treatment, reflectivity, absorption and volume. Some recording engineers are intuitively connected to this formula and have no problem with it. Others never get it. Here is the once-over:

Drums in a room

Let's limit our discussion to basic drum kits: kick, snare, tom toms, cymbals, high hat. First, drums are loud — they move air. They rattle their own hardware. They wake up rooms, exciting them at seldom-excited frequencies. Due to their percussive nature (read: steep leading-edge attack of the waveform envelope), they show up room reflections and flutter where little else does. Their wide, harmonically rich bandwidth faithfully exposes room colorations: the combination of eigen-tones, room modes, standing wave harmonics, reflections, room volume resonance, absorptive coefficients in specific bands, etc. Drums are great this way — certainly better than a Marshall stack or two cellos.

The first order of business with drums is to place them in a location providing sound that is most like what you are looking for. Bright and reflectively snappy may be the trick in the morning, flat and dry later. Awareness of acoustic characteristics apply: The type of flooring, proximity to walls and room treatment, although this

is complicated by the fact that the entire kit occupies a large footprint, interacts internally and covers a large frequency spectrum. Therein lies the interpretive art — use the ears.

The nature of microphones further color the picture. (See *Close-Field Behavior of Drum Microphones* on page 42.) Each mic adds distinct characteristics and filters to the natural projected sound of the instrument. Multiply that by the infinite number of positions possible for locating the mic head and you can develop virtually any waveform you are looking for without touching the EQ.

Acoustic creation

An experienced engineer will quickly indicate the following: A good sounding instrument with any mic will always sound better in the control room than a so-so source with the best mic. Drums are the prime example of the rule — if it doesn't sound good, alter the source. Use another snare drum. Swap out the crash or ride. Change the heads on the toms. No amount of fiddling with the EQ will fix a dull, flat or resonant tub.

Work with the drummer to get the sound that you are looking for. Apologies to the players, but microphones do not hear what the drummers hear sitting on the throne. The fundamental of the sound projects away from the drummer, with the majority of the attack only in their face. The body, or fullness, develops at distance from the skin. The throne position is just not representative of the sound the mic hears. Also, a player gets a certain amount of tactile, vibratory feedback through the floor, seat and stick, filling in areas that the mic does not hear.

Diplomacy counts. Work with the drummer's sound because it is often good, or specific to the music at hand, and the session will go smoother. Obviously, you cannot substitute bigger sticks; ask the drummer to play differently or cut a 6-inch circle in his double-headed kick. You can, however, explain to him that you are trying to capture his sound, which means giving the mics what they want to interpret, which might be different than what is being heard on the hot seat. You know the drill.

But don't be afraid to suggest the necessary, such as swapping out for the studio snare, or taking off the front head of the kick or the bottom skins of the toms. Clearly, the program material will dictate the requirement. What works for acoustic swizzle jazz will not cut it on a dance

record, and vice versa.

Here are some widely known and highly subjective consideration: Large kits don't sound bigger when they are recorded. The tastiest sounds often come from the smallest, tightest sets. Case in point — the biggest, fattest drums I ever cut were from Sheila E.'s tiny, red Yamaha starter kit. The worst, floppiest sound was from a much-touted name-brand concert set that sounded huge on stage but like spaghetti in the studio, no matter how tight the heads were.

Mics hear the sound looser than it is in the room. When tuning or damping the kit, make it right in the room, then go one notch deader, assuming you are close miking. Distance miking is another story, of course. Enough snare sizzle to the ear may be too much to a mic. Also, everything leaks. Work with it to make use of the good leakage.

The point is this: The sound on the other side of the glass, filtered by mics and 2-dimensional acoustics, is different than 3-dimensional hearing in the studio. You must put your face in front of the kit to hear where it is, with the understanding that the mics will subtly alter that reality.

A good arrangement is to place your well-versed second in the room under a set of cans while you sit in the CR. Leak a little program and a lot of talk-back, and direct the alterations by remote.

Tricks for treats

Tuning up a kit has always seemed more black art than not, even to many drummers. The variables are numerous: Hydraulic heads have a lower "Q" or peak resonance than others, so they do not find their exact pitch as easily or tune as high. Because of a greater head mass, they also seem to have fewer higher harmonics and need to be hit harder to bite. Double heads quadruple the difficulty — many believe that the top head's tuning determines the attack pitch, and the bottom determines the overhang resonance. Sometimes, drum tuning drifts with temperature and humidity, of course, let alone the results of being stacked inside one another in a car trunk for two days.

A good technique for tuning seems to be the following: Find the range and key that the drums fall in and let the drummer tune to the partials he prefers. Use a piano if it helps. Then help tune to the purest, cleanest individual note on each drum, looking to diminish the secondary ring or partial unrelated harmonic as much as possible. Play all the pieces in the

kit to see if the other drums cause too much sympathetic resonance on other drums. This is often easier by muting or soloing on the board than damping out in the room.

If the toms or snare need damping, cut out a ring or circle of old drum head to the inside diameter of the head so that the width of the doughnut or ring section is only an inch or two, leaving a hole of six or eight inches in the center for the real head to show through. Lay this on the skin. Vary the amount of damping by how wide the ring is, whether it has a larger or smaller hole in the middle.

If you can, do not tape it down, because the tape will work loosely and will buzz. The ring effectively damps the wave as it travels to the rim, reflects and returns to the center. Knowing that the amplitude of skin travel is greater in the center than at the edges should be powerful ammunition when you apply variable damping to the skin, no matter how it is accomplished.

If a drum needs damping, place an old drum head with the center cut out on top of the head. This works better than duct tape or someone's wallet.

Putting tape on the head is sloppy tuning, because it unbalances the head, makes one-note tuning difficult, limits the room for the drummer to hit and gets in the way of the mic (duct tape doesn't "speak"). A wallet placed on the head works better, but it walks around and still gets in the way. Many heavy-forearm hitters get good results by laying a slice of old T-shirt, cotton cloth or towel over the head with tape on the shell to hold it in place. Whatever works. However, if the drum head needs two pounds of gaffer's tape and a thrice-folded tablecloth to get

it in the ballpark, something else is dreadfully wrong. Save yourself the time and swap out the drum!

Kick drums are less troublesome, because a judicious application of pillow or blanket placed in the bottom usually works. Try to avoid tape on the actual skin — it will start buzzing two takes in. Because of the large size of the cavity, internal mic placement in relation to the beater, symmetrically or not, allows more flexibility than in smaller shells.

The pillow or teddy bear inside the shell primarily changes the cubic volume and

The \$100,000 digital recording and editing you want...for under \$10,000!

The MTU MicroSound-AT™ gives you 16-bit multitrack digital audio-to-disk recording with the editing power you have dreamed of. Now you can: instantly access anywhere in multitrack files up to 94 track minutes, combine sounds from disk or record new material MIDI or timecode sync'd, cut and mix to sample precision, undoing edits anytime in the future, never touching your masters.

With full professional specifications like -110db noise, your mastering will be recognized for its purity. For truly creative work, digitally process your sounds in ways you haven't dreamed of ever doing, such as singing orchestras and variable filtering. Or compute synthesized files in ways no MIDI or human can perform. MicroSound-AT will move you into the future...today!

high-frequency absorption inside the space, which changes the tuning frequency and "Q" of that frequency, as well as the balance of harmonics to fundamental. When in doubt, surprise yourself — get a little starter kick with one head and tune the head right. Everything else will happen magically.

Mic on drums

Short of writing the definitive encyclopedia on placement, it is enough to say that everything works sometimes. Most things work for the wrong reasons, and understanding the physics of small space acoustics always helps. Remember, when you mic a drum closely, you more or less only pick up the pressure wave from the attack of the stick and sympathetic internal resonance coming back through the skin.

You also pick up the reflections of the other drums mirrored off the head. Miking at distance allows the sound to develop or focus, becoming bigger or fatter. Miking at *great* distance allows the lower frequencies from the bottom of the shell to add to the attack from the head. It also picks up everything else in the damned room.

Assuming most readers are familiar with the common practices of placing a mic head above a skin, proper gain staging of the electronics and the ritualistic act called "the getting of the sounds," let's look at some of the more obtuse variants.

With a snare drum, the problem is usually one of practicality. Can you get the mic in close enough without getting in something else's way? Does the mic touch the high hat? Is there too much high hat? Is there too much, or not enough, snare in the sound?

Here are some suggestions: Try any new swivel-headed microphone, which lets you place the mic from an angle and away from the hat. Use a clamp-on bracket system, which has the additional advantage of locking-in the mic to drum head distance as the kit starts rockin'. Play with odd mics, such as a high SPL lav peeking over the edge or taped to a pencil, or an older ribbon at several inches off the rim, out of harm's way. Orienting the ribbon so that its dead 90° side is aimed at the hat is especially nice.

A great trick for fans of signal gating is to patch a lav or small mic, located directly above the snare head, into the trigger input on the gate, with the gating function that controls a snare program mic located 6 to 8 inches away. The gate response time is cheated by the closer trigger mic, allowing full open by the time the lead-

Try experimenting with different mics and positions for unusual sounds. For example, try a lavalier mic attached to a pencil, which is then taped to the snare drum. Does a No. 2 lead sound better than a No. 3? Try it and see what happens.

ing edge of the sound reaches the program mic. The distance placement that this allows on the program mic adds air and color, which a drum head needs for the sound to coalesce. It works well.

Try placing a second mic below the snare, strategically located to minimize kick pickup. Flip the polarity (don't call it phase!) on the board to realign the top and bottom mics, signal-wise. Then again, maybe out-of-polarity sounds better. Play with position for creative cancellation. Or put two similar mics on the same head, tight and parallel to the head, flip the polarity on one and move it back. Try everything once, preferably on billable time. (You're no dummy!)

Totally tom tom

Toms can experience everything mentioned above, with the addition of adding

a microphone inside the shell on a single-skinned instrument. The location inside a shell is crucial, with a smaller mic element usually being more predictable and repeatable than a larger one. In this matter, clamp-on mic brackets keep the wandering to a minimum.

General rules: After you get a good sound on one tom, or between a single tom and the snare, always compare the sound of all the mics you will bring up, in and out of electrical polarity, in stereo panning placement and sum mono. Moving a microphone 1 inch sideways may not effect the sound of the miked drum, but may highly color a drum next door, one whose sound with which you are already satisfied. Don't assume anything. Some mics are wired pin 2 hot, others pin 3. Check the cancellation and addition of all signals, not just for correctness, but for creative aesthetics as well.

On floor toms, try to make the drum mouth non-parallel to the floor. It is not surprising that reflection and standing waves between the floor and the skin greatly distract or contribute to the sound. Place a foam block or a packing blanket under the drum on the floor and see what happens.

Finally, try using one mic between drums to pick up both. It is obvious that the fewer mics that are on the kit, the less interaction there will be.

Kick it out

With kick drum, be aware that room leakage and other drums get into the shell chamber from the back or through the skin, exciting odd resonances. Playing with the working distance to the beater can overcome this (direct to indirect sound ratio), but a gobo or blanket outside the drum often kills leakage without altering the sound in a negative way. Where leakage is not a problem, try taping (with foam standoff) a lav mic to the stalk of the beater on the mechanism. WD-40 will kill squeaks.

A pressure zone-type mic placed slightly in front of the mouth opening will add a different quality to the sound, as will one inside the shell or a second mic on the skin in front, away from the beater, with flipped polarity. Moving the inside mic in or out will create cancellations, selectively altering the sound.

On high hat, try to get the majority of the sound from the snare mic, or use a separate mic, such as a small diaphragm condenser, above the bell and pointing away from a crash or ride, utilizing the hat

to shield the snare sound. Print the hat signal to the kick track, which allows you to independently filter each for separate control later, thereby saving a track channel. Say you read it here first. Also on high hat, put two mics up, flip one's polarity and play with distance, using cancellation as an acoustic EQ.

On overhead mics, don't settle for a spaced stereo pair. If you are not close-miking each cymbal directly, use an overhead stereo system, or try taping the edge of two pressure zone mics in a 45° V or wedge and hanging them above and ahead of the drummer's head. The sound is natural and balanced, although without a larger boundary plane, it is shy below 200Hz or so.

Try something different: Keeping left and right proper, use the other mics (snare, toms, kick) to fill in the missing frequencies, relying on the body of the sound and total imaging to be generated by the overhead pressure zone mics, which are prominent in the mix. The spatial coherence and time domain control is excellent. This works remarkably well for many styles of music and is the reverse from the normal approach of overheads as lower level afterthoughts. Even the snare and hat come across well, needing only subtle reinforcement if correctly completed.

Another approach to cymbals is to tape mics to the cymbals' stand stalks, letting the movement or the wash of the ride and crash alter the sound of the instrument pickup underneath. If the sound is too much alone, try subtly adding it to another mic above, either in or out of polarity.

Using EQ

Let me say a personal word on equalization. The less boost the better. Nowhere more than on the wide bandwidth noise-like character of percussion is it easier to hear phase shift than when boosting large amounts of one frequency. Don't ask yourself, "What would I like to hear more of?" Rather, ask, "What am I hearing too much of?" Almost always, taking out mids to expose the high sounds is better than boosting the highs, though the resultant curve may be identical. The gain staging, headroom and distortion that you improve may be your own.

Several obvious, well-proven EQ points deserve attention. A sharp cut at 600Hz is the quickest way to remove the "big rubber ball" sound on toms and kick. Be

aware that radically boosting anything below 60Hz is dangerous these days, because rumble and junk faithfully translate to compact discs verbatim. Hi pass the bottom out of anything without a low fundamental and choose the one or two instruments in the mix that have real bottom to fill that space.

Finally, watch how much top is added to the hat and cymbals. When digital splatters, it goes to town. There are too many steps and stages after the master 2-track for someone to alter your mix; and top end that crashes into the ceiling is one of the first things to suffer.

A word to the wise

No matter how and where you do it, conventions in drum miking are merely a stepping-off point. There is always room to experiment and rediscover. Thankfully, the possibilities for new sounds, let alone new styles and feels of playing, are so limitless that acoustic drums will never be replaced. And as long as there are drums, there will be new ways to record them. ■

PERMANENT POWER.

Four new amplifiers from Carver Professional. The PM-120 (40+40W @ 8Ω), PM-300 (110+110W @ 8Ω), PM-600 (200+200W @ 8Ω), and PM-900 (350-350W @ 8Ω).

Each with features you've asked us for. Like barrier strip inputs

(along with TRS & XLR's) and 70 volt capability

The new PM-600 and PM-900 also include remote/manual sequential power on/off and rear cover card slot for use with Carver add-in options such as our new PG2 Dual-Zone Paging Module.

Call toll-free, FAX, or write us for complete information including Architects' and Engineering Specs on the powerful, accurate, reliable solutions to permanent installation challenges.

CLOSE-FIELD BEHAVIOR OF DRUM MICROPHONES

By Tim Vear

Photography by Kevin Anderson.

The acoustics of the close-field of a drum are characterized by the sound of a very wide frequency range, the sound of a very wide dynamic range, the sound with extreme transients, and the sound generated by a large acoustic source (or sources).

These conditions may suggest the appropriate general type of microphone to be used, but it is the characteristics of a particular microphone under these conditions that determines the sound character that is ultimately reproduced. A look at some of these characteristics will help to understand the behavior of microphones in this environment.

Transducer type

Excluding the occasionally fragile ribbon device, the two basic transducer types that are typically used for drums — dynamics and condensers — have certain fundamental differences that become

How a mic responds when placed near a drum will determine the ultimate sound character.

readily apparent in drum miking. These differences are in the moving parts of the elements and in the associated circuitry.

In both devices, the moving part consists of a diaphragm that vibrates in response to sound pressure. In a dynamic element, a small coil of wire glued to the rear of the diaphragm generates the output signal when moved through a magnetic field. The combination of voice coil, glue and the necessarily thicker diaphragm results in a moving mass up to 1,000 times greater than the typical condenser diaphragm, which is unencumbered.

The condenser microphone, however, requires additional active circuitry to generate a usable output signal level. This circuitry introduces certain limitations not found in dynamic microphones, which are passive devices and have no electronically generated noise of their own. These differences and others have a direct influence on the frequency response, dynamic range, transient response and directivity of each type.

Tim Vear is an applications engineer for Shure Brothers, Evanston, IL.

Frequency response

Drums have a wide frequency response range, especially when cymbals and other percussion devices are included. Wide range microphones of dynamic and condenser design are available, although the condenser has an advantage at very high frequencies due to its low mass diaphragm.

The frequency response of a drum microphone is profoundly affected by its placement. The dominant effect is a pronounced increase in low-frequency response because the microphone is located closer to the drum. This is known as "proximity effect" and occurs only with directional microphones.

The increase may be as great as 30dB for frequencies below 50Hz within 1/4-inch of the drum head. The actual amount of increase is a function of the microphone's free-field response and its directional pattern: At a given frequency, a bi-directional type has 6dB more proximity effect than a cardioid, with supercardioid and hypercardioid types falling in between.

The off-axis frequency response of a microphone is equally important in determining the overall pickup because sound arrives at the microphone from many directions when it is positioned close to a large sound source, such as a drum. This is why microphones with similar on-axis response may sound quite different when used in a close-miked drum application.

Dynamic range

The dynamic range of a drum kit is the difference (in decibels) between the loudest and softest sounds that it can produce. At distances within 1 inch, the sound pressure level (SPL) from a snare drum (typically the loudest source) may approach 155dB, while the minimum level will be the background noise level of the room, perhaps 25dB SPL for an extremely quiet recording studio.

The dynamic range of a microphone is normally defined as the difference (in decibels) between the noise floor of the microphone and the maximum input SPL that it can handle without distortion. This is related to the sensitivity of the microphone and its signal-to-noise ratio: Sensitivity is the electrical output level for a standard SPL (usually 74dB or 94dB), while signal-to-noise ratio is the difference (in dB) between the sensitivity of the microphone and its noise floor.

For a dynamic microphone, the noise floor is only a function of its resistance (approximately the rated impedance) since it has no active (noise generating) circuitry. The maximum SPL for a dynamic, though not often stated, is typically above 155dB. This gives dynamic microphones a dynamic range that is suitable for high-level drum miking applications.

It is usually not possible to overload a

dynamic microphone even with close miking. However, its sensitivity may not be sufficient (especially at high frequencies) to pick up low-level sounds with an adequate signal-to-noise ratio.

For a condenser microphone, the noise floor is primarily a function of the electronic noise generated in its active circuitry, though it is still low in high-quality designs. The maximum sound level for a condenser is generally not limited by the element, but by this active circuitry.

At some SPL (usually stated in the specifications), this circuitry will be limited by its voltage ceiling and distortion. It is possible to design condenser microphones capable of handling levels above 145dB, but only at the expense of a higher

noise floor. However, a condenser microphone may be designed with higher sensitivity (especially at high frequencies) and greater signal-to-noise ratio than a comparable dynamic, thus making it more suitable for pickup of low-level sounds.

Transient response

The nature of sound produced by drums and other percussion instruments is transient — it consists of many short-duration, large-amplitude waveforms. To reproduce these sounds, a microphone element must respond quickly and accurately. The transient behavior of a microphone is related directly to its high-frequency response and to the nature of its mechanical and electrical resonances.

Figure 1. Cutaway diagrams of a unidirectional dynamic mic (top) and a unidirectional condenser mic. The differences in each mic's construction have an influence on the frequency response, dynamic range, transient response and directivity.

Extended frequency response in a dynamic microphone is usually obtained by the use of several acoustic resonators in addition to the basic mechanical system formed by the diaphragm and voice coil. In general, the higher moving mass and multiple resonators of dynamic microphones reduce the speed and accuracy of their transient response at high frequencies. However, the effect on low-frequency and mid-range sound is minimal.

With a much lower mass mechanical system and less reliance on acoustic resonators, the condenser microphone has the potential for better transient response than a comparable dynamic. It is necessary, however, that the active circuitry of the condenser also have excellent transient response within its dynamic range. This can usually be achieved in high-quality designs.

Acoustic source

The physical size and shape of percussion instruments have a marked effect on the sound picked up by a close-field microphone. The sound of a drum radiates not only from the head(s), but from the shell and rim as well. The head is not a uniform source of sound; it has many vibration modes that depend on where and how it is struck, how it is tensioned

and how it is damped. In the snare drum, for example, the sound from the bottom of the drum is completely different from that of the top because of the snare mechanism on the lower head.

As mentioned earlier, the sound reproduced by a microphone is a composite of its on-axis and off-axis response. The on-axis sound source will be that portion of the drum that is immediately in front of the microphone, but the off-axis sound consists of other parts of the head and the drum plus the direct and reflected sounds from nearby drums or other sources.

The balance of on-axis to off-axis sound is determined primarily by the distance of the microphone to the sound source and by its directivity. Some off-axis sound will be heard and the fidelity of the off-axis pickup will determine whether this enhances or detracts from the overall sound.

Because most drums are not played in isolation from other instruments, directional microphones are often used to minimize leakage of sound from off-axis sources. However, the directivity of any microphone varies to some extent with frequency, especially for larger models. When the proximity effect of a directional microphone is added, distance and orientation strongly influence the final sound. Since condenser microphones may

be made smaller than comparable dynamics, they may often be mounted more precisely.

A further consideration for a large sound source, such as a drum kit, is the use of multiple microphones. Interference effects may occur when the sound of one drum is picked up by more than one microphone. This can only be determined by listening to the combination of microphones, rather than to each individually.

Although we can characterize the sound of the close-field, its effect on different microphones varies considerably. It is not possible to predict the total "sound" of a microphone in a close-field application solely on the basis of published or theoretical specifications. Only actual use and experience can yield this information.

In addition, any attempt to capture the sound of a drum with a microphone at one, or even several, locations cannot reproduce the total sound of the instrument. A microphone samples one small point in a large, complex sound field. Placement may be critical and will vary with different kinds of drums and microphone models.

Selection of a particular microphone will be based not only upon its ability to deliver a desirable sound, but also on ease of use, flexibility, durability and cost. ■

FIVE QUESTIONS:

Studio Microphones

Q: Modern design technology seems to have improved the performance of studio microphones over the years. Where can I attain applications brochures or specific info on mics I can't find locally?

A: Even the smallest mic suppliers have marketing departments whose prime purpose in life is to inform customers about their product. Almost always, a call to a

company's headquarters will net the information you are looking for.

Most mic companies design and build many more microphones than they advertise, or that the average pro audio dealer stocks. Some mic companies (like Schoeps, Milab, Josephson, Beyer and Sanken) with traditionally smaller advertising budgets, build excellent though harder to find products. Others, like Crown with their PZMemo, provide good newsletter application notes, yours for the asking with a single phone call. Call your local dealer or the factories directly for the appropriate info.

The Academy heard it

(With one major exception.)

So will you.

The performers and audience at the Grammy Awards have the most critical ears in professional audio. The last sounds this group of top artists, engineers and producers want to hear is phase shift or the pumping of a processor-based loudspeaker system.

And they didn't. Because for the second consecutive year, Apogee speakers were selected as the house sound system for this prestigious event. No sliding filters. No floating crossovers. Just clear, natural sound with less electronics and fewer cabinets than many conventional systems.

Apogee processors do have all the functions you

need—frequency division, time domain alignment, bandwidth protective limiting, precise equalization in well engineered, finely tuned circuits specifically designed for use with their respective loudspeakers.

Model A-3x3 Single Channel, Permanent Version Processor

Optimized electronics = optimum signal quality. And Apogee systems are easy to install, easy to arrange and quick to take on the road (ask about the full complement of rigging hardware).

Q. What alternatives do I have for mounting drum mics, other than regular stands and extension booms?

A. The following companies manufacture brackets and clamps to simplify your mic setup:

Atlas/Soundolier: 1859 Intertech Drive, Fenton, MO 63026; 314-349-3110.

AKG: 1525 Alvarado St., San Leandro, CA 94577; 415-351-3500.

Beyer Dynamic 5-05 Burns Ave., Hicksville, NY 11801; 516-935-8000.

Shure Bros.: 222 Hartrey Ave., Evanston, IL 60202-3696; 708-866-2200.

Black Audio Devices: Box 106, Ventura, CA 93002; 805-653-5557

Q. I have some great old microphones that don't sound quite right anymore. Where can I send them to have them refurbished or rebuilt?

A. All the major mic manufacturers and many independents offer refurbishing and factory servicing for their microphones. The following companies can be contacted at the addresses and numbers listed below:

AKG: Attn: Mic Repair, 1525 Alvarado St., San Leandro, CA 94577; 415-351-3500.

Audio-Technica: 1221 Commerce Dr.,

Stow, OH 44224; 216-686-2600.

Beyer Dynamic 5-05 Burns Ave., Hicksville, NY 11801; 516-935-8000.

Bruel & Kjaer: Attn: Service, 185 Forest St., Marlborough, MA 01752; 508-481-7000.

Electro-Voice: Attn: Repair Dept., 600 Cecil St., Buchanan, MI 49107; 616-695-6831.

Neumann: c/o Gotham Audio, Attn: Joe Leung, 1790 Broadway, 8th Floor, New York, NY 10019-1412; 212-765-3410.

Sanken: c/o Audio Intervisual Design, Attn: Andrew/Service, 1032 N. Sycamore Ave., Los Angeles, CA 90038; 213-469-4773.

Schoeps: c/o Posthorn Recordings, Attn: Jerry Bruck, 142 W. 26th St., New York, NY 10001; 212-242-3737.

Sennheiser: Six Vista Dr., Old Lyme, CT 06371; 203-434-9190.

Shure Bros.: 222 Hartrey Ave., Evanston, IL 60202-3696; 708-866-2200.

Sony: 1600 Queen Anne Road, Teaneck, NJ 07666; 201-833-5300.

Q. Is there a good book I can give to my second engineers to get them up to speed on mic techniques and applications?

A. R•E•P recommends the following

books (note that several may be overly entry level or steeped in design explanations):

Sound Recording Handbook, by John Woram, Howard W. Sams & Co.

The Microphone Manual: Design and Application, by David Miles Huber, Howard W. Sams & Co.

Also, contact various microphone manufacturers that may have brochures available.

Q. Does super high-quality microphone cable make that much of a difference, or is it advertising hype?

A. If you haven't heard the comparison, you owe it to yourself to try the following: Get 100 feet of regular old off-the-shelf 2-conductor braided shield mic cable, and 100 feet of a high-quality low-capacitance/low-resistance mic cable (such as Mogami or Canare). Plug in a mic (any mic will do) to one of the lines, put on a good set of headphones and jangle some car keys. Swap cables.

If you can't hear the difference between the two cables, it's probably time to retire. The longer the cable run the more obvious the difference. In short, good low-capacitance cable makes a noticeable improvement. ■

all.

Now available in single and dual channel models, Apogee's second generation processors enable you to precisely tune the protection circuits to keep amplifiers from clipping. New rubber conductive front panel

Automatic EQ: The Great Myth

By Mike Joseph

One of the big buzzes in the sound reinforcement industry is the heated discussion over automatic (or automated) house and monitor system equalization.

The entire issue is rife with complexity. Most practitioners agree that quality mics and real-time measuring devices alone can not provide the perfect room EQ. As for tuning by ear, no matter how good you are, your brain identifies peaks better than dips, correlates in stereo, is axially dependent, compensates for indirect sound in a reverberant sound field and lives inside your skull, which is connected to the rest of your body, which uses its fingers to adjust the EQ knobs, which all told do not let your ears get out into the room's sound field. Mics do not suffer these problems in the same way.

Conversely, anyone who has stuck a single microphone up in a room and plugged in a 1/3-octave analyzer knows the tentative nature of the act. "X" number of different speaker devices played in "X" number of zones in a typical large venue suggest that it is highly questionable to trust the effectiveness of a single stereo-strapped graphic EQ device.

Mike Joseph is technical editor of R•E•P.

Excluded is the issue of frequency resolution and phase integrity of the various equalizer designs: graphic, parametric, fixed Q sweep, graphometric, digital, digital control of analog, non-symmetric combining, etc., with their different slopes, Qs and band-to-band interactivity.

In theory, wouldn't it be nice if we could run some noise through the system, read the room response with a mic and have a "smart" EQ subtract the room effect from the original signal, adding in the appropriate 1/3-octave EQ? Systems like the 1128 from T.C. Electronics can do that. How smart are they? Well, what do you want to do? Do you want to have the system set itself up with noise before the show so the response is flat on a given speaker's main axis (plus or minus any aesthetic house curve you add)? That's easy.

Do you want to make it flat with noise in eight different measuring points in the house?

Do you want to measure the interaction between those zones? That is harder still. How does EQ/analyzer No. 3 know that the low end from speakers/zone No. 4 isn't part of its signal output, turning down, in effect, the low end to take care of what is really a side lobe from next door?

Do you want to elevate this all one level and have the system use program material during the show as the signal source instead of noise, while compensating for indirect versus direct sound, meaning time domain signal alignment? Look out! Your equipment jumps to the level of multichannel fast Fourier transform analyzers

with full storage capabilities, delays, a computer to drive the package, multiple system sample points, inverse signal comparison and a level of setup complexity rivaling the main P.A. itself.

And it still does not know if the bass coming off the stage is from the musical instrument amps or the monitor fills. Do you really want it to turn down the house low end automatically because the sample mics in the room say "too much," even if there is no bass in the house mix? This sounds too much like dueling equalizers, pitting the house zones against the monitor mixes against the stage sound.

The human operator will and must be in the loop for the foreseeable future, even if only as a link between the "We have a problem/do you want me to fix it?" prompt on the screen and the button that says, "Push to engage EQ correction."

If this is even slightly intriguing to you, then read with special interest the short series beginning with this month's article from Apogee Sound on the reality of state-of-the-technology equalization systems.

Next month, following up Apogee's CORRECT article, we will run a piece on the Meyer SIM measurement and equalization system, currently enjoying considerable use around the world. We hope the presentation of the truth behind alternative approaches to improving sound system response via computerized FFT analysis and parametric equalization will be educational — and maybe even bust a myth or two.

Just don't call it automatic equalization.

What you see is what you get...

Better sound through research.

Computerized EQ Systems

By Ken DeLoria

The CORREQT system is, at once, a philosophy of sound system design and practice, a technique and an evolving compilation of hardware and software.

Its mission is to enlarge, develop and extend the performance results of the Apogee loudspeaker line, particularly and especially when the loudspeakers are utilized in reflective acoustic environments. This utilization of the loudspeakers accounts for the majority of typical applications of the Apogee product base that is presently in distribution.

Ken DeLoria is the founder and CEO of Apogee Sound, Petaluma, CA.

Origin

CORREQT was developed during a 3-year period to answer the needs of sound designers and consultants who were using Apogee speaker products in demanding situations. These users were experiencing variable perceptions of speaker response performance characteristics as they changed venues, which is not unique in the sound reinforcement field.

A common concern emerged among the various users that there should be a way to minimize the contribution of the room's acoustics, thereby improving the consistency of the sonic results from location to location. Frequency response, projection pattern uniformity, signal arrival-time consistency and dynamic power handling were all factors to be considered.

The Apogee loudspeaker line had been engineered to minimize non-linearities in

most configurations and operating levels. Because of the linear nature of these loudspeakers, it was relatively easy to identify the independent characteristics of the acoustic environment as the greatest variable and the largest contributor to overall system performance variables. (System is defined here as the microphone(s), mixer, processor(s), amplifier(s), loudspeaker(s) and acoustic response characteristics of the room.)

A method was developed to solve these non-linearities involving:

- The use of the transfer function measurement response of a 2-port FFT-based spectrum analyzer to identify the non-linearities.
- The deployment of precision parametric equalizers to correct response, thereby linearizing the system performance.

The dual-channel FFT, an essential piece of instrumentation, had become common-

Figure 1. The typical process for using the CORREQT system is: A: Room Mode; B: Inverted EQ Mode; C: Result Mode; D: Normal EQ Mode.

A discussion of the Apogee CORREQT system, including its origin, philosophy and future development.

place at Apogee for research and development work and routine production testing. Research revealed that the dual-channel FFT, when used as a 2-port network analyzer, could effectively form the basis of a response correction system by measuring the transfer function of the system. (Transfer function is the result of dividing the spectrum that is present at the input to one channel of the analyzer by the spectrum that is present at the other channel.)

By using precision parametric equalizers, you can effectively null the acoustical environment's response irregularities and much of the resulting sonic coloration. You can also demonstrate a measure of control that was previously unavailable by simple $1/3$ -octave analysis or parametric equalizers alone.

Development

To develop the system, the acoustic characteristics of many sizes and shapes of rooms were analyzed. We found that the most significant deviations from flat linear response are attributable to the room character, rather than speaker placement or multiple speaker interaction. This coloration was usually in the low- to mid-frequency range, approximately 40Hz to 800Hz. Virtually all rooms that were measured displayed multiple narrow-band resonances. Peaks of 6dB to 10dB, which were only $1/10$ -octave to $1/3$ -octave wide, were common.

Using precision parametric equalizers to alter the electrical response by the precise inverses of the acoustic response anomalies

yielded remarkable results. A typical subjective reaction to the corrected response was a reverberant field. Rooms were said to be "drier" and intelligibility factors, especially of podium and lavalier microphones, rose dramatically. Levels before feedback increased. RT60 measurements showed significantly less reverberation without the loss of full-range system response from the usual methods of restricting bandwidth via less specific equalization, such as $1/3$ -octave graphics.

After the empirical data was collected and collated under a wide range of conditions, a basis was formed for the validity of the technique. The conclusion was that by attenuating the energy at those specific frequencies where the room had natural resonant modes, an operator could significantly and perceptibly decrease the overall resonance of the room without adversely limiting the frequency response of the system.

The effectiveness of the technique was a function of the following four factors:

- *The characteristics of the reverberant field.* This affects the potential for altering the perceived reverberant characteristics of the room. If the reverberant field is reasonably flat with smooth high-frequency roll-off characteristics, the ability to alter the room sound by equalization of the system (without adversely affecting the direct sound characteristics) is not as great as in a room where the reverberant field exhibits significant peaks and dips in response.
- *The presence or absence of room resonance modes and their relative intensity.*

Similar to above, rooms that exhibit strong low-frequency resonance modes that are narrow in Q, harmonically related and spaced apart by two to three times their Q factor, can be easily flattened without creating adverse side effects. Rooms which do not exhibit easily identifiable resonance modes, or where the modes are very wide, are more difficult to equalize to advantage.

• *The presence or absence of significant acoustical anomalies.* Severe acoustical problems, such as pronounced flutter echoes, discreet echoes, or radical response variations from one area of the room to another, are problematic and can be challenging to improve with equalization. Typically, some improvements are realized; however, a highly consistent sound field throughout the seating areas may be impossible to achieve.

• *The choice and placement of loudspeaker(s); i.e., the overall system design.* Just as a poorly designed room may be problematic in nature, a poorly designed loudspeaker or loudspeaker cluster may be difficult or impossible to improve with equalization. Also, the placement and focus of the loudspeakers will ultimately dictate the obtainable end results. The system design needs to be approached in a methodical and informed fashion to allow the CORREQT technique to achieve its full potential.

Methodology

A 2-port analyzer, in this case a Hewlett Packard 3582A FFT Analyzer, with its abil-

C: RESULT MODE

D: NORMAL EQ MODE

ity to compute transfer function, is used to measure the system response during initial system setup. This is accomplished by stimulating the system with the internal periodic noise source of the analyzer and displaying the signal from a measurement microphone placed in the room. This method yields rapid measurement response for quick setup because of the easily read nature of the stimulus noise signal. (Note: Periodic noise is white noise that contains timing information, allowing the analyzer to read time domain response in addition to frequency domain response.)

Typical room resonance modes can be narrow in bandwidth. Therefore, the extremely narrow, precise nature of many equalizer corrections indicated by the measurement results in raised concern about the stability of the system. Would such specific settings of the equalizers be valid as room conditions changed (such as temperature, humidity or volume of air in the room displaced by patrons)?

The 2-port analyzer again proved to be the answer. The system response is continually verifiable during actual performance, with the house full of patrons, by utilizing a transfer function computation to compare the electrical response of the program material on Channel A to that of the acoustic response (derived from measurement microphones) of the loudspeaker and room characteristics on Channel B. By averaging the data, a stable and interpretable trace is produced even with sporadic and dynamic program material as the system stimulus.

Any deviation from linear (flat) response is readily shown and can be manually cor-

Figure 3. Channels A and B amplitude vs. frequency response display, using program material as the source. Although an indication of the overall spectral content of the program material is displayed, the characteristic of the equalizer's setting is impossible to determine.

rected through the parametrics during the performance. The averaging shows the corrective curves developed during system setup, when the faster technique of using periodic noise as the stimulus was employed instead of the performance program signal.

It is important to note that the usefulness of the precise narrow band corrections that are typically employed with the CORREQT technique would be invalid, and possibly detrimental, if the results could not be monitored and subsequent-

ly altered throughout the show as conditions changed. This is because of the inevitable shifting in the room's acoustic characteristics. This happens because of the absorptency and displacement changes, along with changes in temperature and humidity conditions, when an empty room fills up.

As a practical example, during the 1990 Academy Awards ceremony at the Dorothy Chandler Pavilion in Los Angeles, a 14dB cut with a bandcenter of 70Hz, 1/6-octave wide (one of the primary resonant modes of that room identified during rehearsals) needed to be changed to a band center of 84Hz during actual performance, with a house full of patrons. Leaving this cut at 70Hz would not have helped attenuate the room resonance mode and would have created an acoustic "hole" at 70Hz.

However, by tracking the system's response and adjusting the filters accordingly, the valuable correction that has been established during rehearsal was returned to produce the same result during performance. (Note: A typical CORREQT setup may employ as many as 50 to 60 filter points across all of the loudspeaker coverage zones.)

A validity check on the significance and usefulness of the data can be made by using the coherence function of the analyzer. This is important, because the process of acquiring valid data is a function of the coherence of the timing information between the signal arrival at both of the analyzer's input channels. One input channel is the direct line level from the board and one is from the microphones. The former must be accurately delayed to

Figure 2. Channels A and B amplitude vs. frequency response display, using a periodic noise source. Note the clean display with high resolution because of the uniformity of the test signal.

THE WEIGHT IS OVER

520 lbs. = 235 kg

Introducing the new KP-600 Series flyable speaker system from KLIPSCH®. No longer does breathtaking sound translate to backbreaking weight.

A full-range, fully-featured, three-cabinet stack that's ready to fly weighs less than 520 lbs.

To really lighten your load, you can move the system one cabinet at a time. Or you can use the rigid assembly hardware, put the whole stack on its wheel tray, and still move it without much of a strain.

The secret is in the cabinet construction. A super-light composite material molded around a rigid aluminum skeleton. The result is a stronger, lighter, cabinet that remains free of unwanted resonances.

The fact that the KP-600 Series is lightweight is just one of many things that makes this system a heavyweight contender.

Consider its maximum continuous output of more than 131 dB. Consider its frequency response of 43 Hz - 17 kHz \pm 3 dB. Consider its modular design that lets you easily rotate or interchange the horns for the best polar coverage. Consider all the infinite design details that help you hook it up and hoist it up, quickly and easily. Consider the simple fact that it sounds great, too.

For some informative literature about the new KLIPSCH KP-600 drop us a line at the address below. Or if you don't have time to "weight," give us a call.

 **klipsch**[®]

FAX 501-777-6753

match the transmission delay of the loudspeaker's acoustic energy, which is relative to the microphone positions.

Secondary systems

Once the main system's resonant modes have been defined and corrected, the addition of secondary or ancillary loudspeakers (side or front fills, center clusters) can re-excite, and to some extent undo, the careful work of correcting the primary system's response.

A technique was developed to deploy ancillary loudspeakers without adverse effects by locating the measurement microphone in the physical area that the secondary loudspeaker is intended to cover. A measurement is taken with this secondary loudspeaker switched off and the primary or main system on. After the response is viewed, the ancillary loudspeaker's response is shaped with the equalizer to fill in the loudspeaker's coverage zone with the frequencies not represented by the primary or main loudspeakers.

In this manner, the secondary loudspeaker system does not add additional energy to the room at frequencies not required in its coverage zone, if this energy is present by virtue of carry over or "spill."

System equipment

The equipment used for CORREQT consists of:

- A set of calibrated measurement grade microphones, typically one or more for each major loudspeaker coverage zone. B&K 4007 and 4011 types can be used with good results.
- A Hewlett Packard 3582A dual-channel FFT-based spectrum analyzer.
- A signal router, which accesses the inputs and outputs of the various equalizers that are patched into the system; accepts and selects the signal from the measurement microphones and routes selected signals to a digital delay unit and to the two input channels of the FFT analyzer.
- A high-quality digital delay for time/distance alignment of the source signal (typically line level at the EQ) and measurement mics.
- A computer controller that interfaces to the HP 3582A through the GPIB port. The computer allows indefinite storage and subsequent retrieval of response traces, and provides control functions for easy use.

Applying the system

A typical approach to apply the CORREQT technique to a room follows (see Figure 1):

- The normal system setup is stimulated with periodic noise or program material. The switcher is first selected to show the un-equalized room response at a given mi-

Figure 4. The coherence display (Trace A) and the transfer function display with Channel A referenced to Channel B (Trace B). The equalizer settings are easy to observe and they reasonably track the measurement made with the periodic noise source. Where the coherence is low (top trace), the accuracy of the transfer function response (bottom trace) is compromised.

crophone location, which is usually covered predominantly by a single loudspeaker or stack covering a limited area. This is called a zone.

A mode is selected on the switcher that routes the output of the equalizer that is associated with this zone (delayed by the precise increment of the loudspeaker's transmission time to the measurement microphone), to the A channel of the FFT. The measurement microphone output is routed to the B channel input. The resultant amplitude vs. frequency trace is stored and displayed from the analyzer's memory. This trace represents the room response.

- A correction curve is manually set on the equalizer and displayed in inverted form by resetting the switcher to route the output of the equalizer to the FFT's Channel A input and the input of the equalizer to the Channel B input. The equalizer curve should be adjusted to overlay the stored room response curve. This trace is the inverted correction curve.
- The switcher is again reconfigured to display the results of the corrected system response. For this display, the input to the equalizer (again delayed by the transmission time) is routed to channel A of the FFT and the measurement microphone signal is routed to channel B. This is the corrected room response. Additional and ongoing adjustments are usually made in this mode.
- The normal, non-inverted equalizer response is then displayed as a check and to study storage purposes.

By repeating this process throughout a

number of frequency spans and in the different loudspeaker coverage zones, a linearized system response is obtained. A major assumption is that there are no significant non-linearities in the loudspeaker arrays or other system components driving the speakers themselves, such as frequency, level compression, headroom limitations and pattern anomalies due to poor array combining.

The future

The power of advanced equalization techniques is starting to emerge as a star in its own right, rather than a walk-on extra. Highly visible shows, such as the internationally broadcast Grammy Awards and Academy Awards that have both used Apogee's CORREQT system for the past two years, have proven the value of having a full-time equalization operator on staff during system installation, rehearsals and the show.

The future development of sophisticated hardware and software will allow the process to be performed in a semi-automated manner, eliminating the requirement for the separate operator, lowering the labor costs and broadening the potential user base. Additional breakthroughs in hardware and software control systems will allow the process to be understood and mastered by operators who may not possess training of instrumentation usage. ■

Editor's note: Part 2 of this series, covering the Meyer SIM system, will appear in the July issue.

Hot Cakes That Cook.

Producers want their duplicated recordings to sound as hot as the master. So, you've got to use tape that lets their music really cook. Tape that's especially hot on the top end.

CintasCHROME™ pancakes really stack up to BASF* and AGFA* when it comes

to delivering those steamy hot highs, low noise and consistency, pancake after pancake.

There's just one difference. When you use CintasCHROME Audio Duplicating Tape, you'll save a lot of dough. For your free samples, call Bob Piselli at (904) 445-5545.

Archie  TM

STUDIO MANAGEMENT SYSTEM

By Robert Missbach

A modern studio churns out pounds of paper everyday — everything from track sheets to cue sheets, stock orders to trouble reports, work orders to invoices. In larger studios, perhaps a dozen different people have to share data from these sources.

The studio manager may book a session by collecting data about a client (record company, independent artist or producer), scheduling a room, ordering the necessary equipment, assigning engineers and alerting them to the session requirements. The assistant engineer must log out tape from stock, keep a tracksheet for each song, keep a tape legend for each tape, fill in the daily work order with hours worked and materials used, and fill out repair requests for the maintenance engineers.

The engineers, in turn, must act on the reports, schedule and log maintenance, and order spare parts. The office manager must collate the daily work orders, prepare invoices for the time, material and equipment used, handle accounts payable and receivable, perform payroll duties and generate accounting reports.

Every studio has its own version of paper forms to carry this data, some of which have evolved over time, some adapted from other uses, others "appropriated" from another studio whose system has shown success. The end result of this paper moun-

Robert Missbach is a San Francisco-area independent recording engineer and producer whose credits include albums by Huey Lewis & the News, Santana, Journey and Michael Bolton.

Operational Observations

What Archie attempts is ambitious. In one package, it incorporates every reporting, tracking, scheduling and archiving function known to modern studio operations. Since all departments are relational, a change of data in one layout appears immediately in all reports using that data.

Most internal calculations are automatic, such as entering applicable sales taxes, totalling invoices or statements, and depleting inventories when an item is entered on a timesheet. A financial section tracks checks and deposits, reconciles statements, and produces journals and monthly reports. There are layouts for box and tape labels, mailing labels and check printing (using pre-printed check blanks).

It is probable that many studios will not employ all of the program's many features. There is a great amount of data that must be entered to make the system work, a chore that requires time and thought. To be effective, all of the studio data must be in the system.

Some glaring inadequacies are immediately evident. First, there is no way to change the layouts. Also, the number, size and placement of entry fields is not a user-definable option. While most of the forms are usable as is, the one form that is arguably the most used and most necessary in a commercial studio is the work order/timesheet. This is the point-of-sale document around which all other invoicing, inventory and scheduling must revolve.

Another fault is that Archie features only one line for entering session start and stop times. In most large, active studios, this does not reflect reality. A session usually starts and stops different activities several times throughout the day.

Archie provides three separate fields (and rate structures) for Tracking, Mixing, and Editing/Copying. These fields may be redefined as needed: Analog Tracking, Digital Editing, 48-track Mixing, Downtime, etc.; but there is only one entry line per timesheet for each of the three.

Many record companies require an account of how much time was spent on a certain song. Often, producers need to track the time spent by individual performers (guitar overdubs, backing vocals, programming) for payment and credit purposes. Meal breaks and downtime should be listed for hourly clients.

There is a Miscellaneous Charges field with a single total, which can be used to gather some of these entries. However, this is a blank, unformatted field that does not self-total and is not an ideal way to log these activities. Miscellaneous Charges should be for catering, rentals and other services that are pertinent to the session. It should contain an itemized cost field and return a calculation field of these charges to appear on the timesheet and invoice for clear accounting. Archie provides no way to change this.

The use of the run-time version of Double Helix precludes user definability of layouts and fields. If users had the full developer's version of Double Helix (a costly acquisition) and were able to acquire the password from Archie's authors (an impossibility), they could change whatever they wished. But Archie was not intended to be a user-definable medium, so users must accept the existing layouts or pay a little extra to the publishers for customization. Mr. Alcock strongly resists customizing via their programmer, because it makes upgrades more difficult to distribute.

Features and Limitations:

Accounting: Archie allows only one account — a checking account. There is no petty cash fund, no additional checking accounts, or savings or credit accounts. All source and disbursement accounts are listed together; there is no separation between income, expenses, capital or credit categories. The journal report lists transactions individually, not tallied by category. There is a Monthly Subtotals by category, but it does not show totals to date, by quarter or for the year.

Statements print a list of invoices due, but not payments received. There is a feature that specifies that a payment be applied to a given invoice, but this merely removes that invoice from the list on the statement.

Lists: The databases for Clients, Vendors, Producers and Engineers produce lists, and one may "query" to extract a selective list based on criteria in the base. However, this reduced list cannot be printed nor viewed as a list, only flipped through like a stack.

Sessions: The tracksheets contain all of the expected fields, plus some helpful additions, such as a field for tempo that gets delay-in-millisecond conversions, and SMPTE start and stop times to calculate the elapsed time. However, starting a

Sample Timesheet, with room at the top for the facility name and logo.

58 R•E•P June 1990

tracksheet begins a series of forms that must be completed. A master tape log entry must be made, then a cue sheet, both resulting in a title list. These are useful documents, but very time-consuming for an assistant to perform during the session, when all he wanted was a tracksheet. There should be a way around this.

Printing forms: There is no choice of type fonts. This most sacred of Macintosh conventions is unsupported. The Double Helix Engine contains only a single font, Geneva 9, which is a screen font that works passably on the screen. However, when a studio is issuing an invoice for a few thousand dollars, users might want something with a bit more class. (Note that most Postscript laser printers would substitute a laser font like Helvetica.)

Highlights

- Relational database using the Double Helix Engine.
- Includes 34 separate databases or relations, including Timesheets, Invoices, Stock for Resale, Master Tape Library, Equipment Inventory, Clients, Producers, Vendors, Engineers and Accounts Receivable.
- System requirements: Macintosh Plus, SE, SE/30 or II; System Software version 6.0.2 or later with at least 2MB of RAM; hard disk with a minimum of 2MB free space.
- Price: \$995, single-user version; \$1,325, multi-user package (supports up to four stations); additional station copies at \$150 each.

Circle (105) on Rapid Facts Card

There is a good explanation for this, however. Arbitrarily changing fonts would wreak havoc with most of the entry and display fields, which are carefully sized and positioned within the layouts. A menu choice of fonts for some printable forms, like the invoices, would be desirable, but this feature, again, is not supported within the Double Helix Engine.

The developer whom I spoke with works within the limitations of the runtime version, although he expresses an interest in seeing an intermediate version from Odesta that might allow some flexibility.

Speed: Archie is slow. This is a computer fact of life — the bigger the file, the slower it works. Since Archie is one large relational datafile, it carries a lot of weight. The idea really is to put everything that the studio does into it. With a IIx, it is sluggish; with a Plus, it is painful.

Unfortunately, it is not possible to "cut loose" the relational interlinks to minimize re-figure time. Note that some CAD programs, which have a similar problem in that they refresh the entire screen every time you alter or add to them, manualize the redraw function — they only refresh when told.

Wrap up

Archie tries to accomplish a lot; perhaps it attempts too much. What choices does a studio have? If every business had a resident computer wiz to develop databases, applications and the links between them, and had an accounting department versed in the latest electronic bookkeeping techniques, they would not need Archie. Many smaller studios do not have these resources and, therefore, must rely on one man's idea of how to do it. Archie might be perfect for them.

With an installed base of over 100, chances are that some find Archie to be

everything they need and more. Others have needs that Archie cannot address. For them, a better choice is to develop their own program from the many applications available. They may not get everything in one package, but the separate pieces will probably work faster, easier, and allow often-needed customization and stylizing.

By all means, if you are in the market and looking, do not pass up this all-encompassing program. Realize where the compromises live, and how they may or may not fit your case. ■

Do You Know these terms?

Monitor — a reference loudspeaker system for the mixing and mastering of recorded music.

Standard — a reference from which qualitative judgements can be made.

Tracks — (noun) channels on a multi-track recorder (verb) accurately reproduces the audio qualities of another transducer.

Monitor Standard™ — a close-field recording monitor system from RADIANT. *The only one which accurately tracks large recording monitors.*

What does all this mean?

RADIANT's new MM-8 Systems are the only close-field monitors to utilize *full-sized compression drivers*.

RADIANT's new MM-8 Systems reproduce explosive transients with clarity and ease. *No more distortion or break-up from fragile domes and cone tweeters.*

RADIANT's new MM-8 Systems provide *coherent, point-source* sound for superior stereo imaging.

RADIANT's new MM-8 Systems eliminate the "sweet spot." Their ultra wide-angle (120°) dispersion delivers *the same tonal balance* to everyone seated at the console.

Model MM-8

Call RADIANT to arrange for an audition in your recording studio. RADIANT Monitor Standard™ Systems are sold exclusively thru Authorized Dealers.

First Look

By Laurel Cash-Jones

A new venue

The folks at Soundcraft have come up with what I think is this year's most appropriately named product — the Venue sound reinforcement console.

The Venue has eight buses and mute control, and has seven combinations of four frame sizes with an overbridge available for the larger frames. The overbridge has standard VU meters and integrated peak LEDs.

This new console also features full 8-bus routing and six independent auxiliary sends. The mono and stereo input modules have mute group capability, which allows each channel's status to be controlled by four master mute buses for rapid resting during a performance.

There are also four dual group/stereo FX return modules with insert points and a dual matrix module to use primarily where matrix speaker feeds are used.

Circle (101) on Rapid Facts Card

I want to take you higher

QSC is introducing one of the highest power-rated amplifiers ever. The MX 4000 is rated at 750W per channel at 8Ω, 1,125W per channel at 4Ω and a whopping 1,500W at 2Ω.

With all of this power, the MX 4000 takes up only three rack spaces and represents a new, enhanced design approach for QSC. It utilizes an "open architecture" via input connectors mounted on a removable module. This module allows for interface with control systems as they develop and will be compatible with a second generation of signal processing devices that QSC is currently developing.

These new circuit designs include a built-in limiter that prevents excess clipping and acts quickly and smoothly to re-

duce power if the amplifier's temperature becomes extreme (similar to an electronic aspirin). Another unique feature is its rear panel, which utilizes not only the traditional 5-way binding posts outputs and XLR/barrier strip inputs, but three Neutrik Speakon speaker jacks. Two Speakons provide channel 1- and 2-speaker interfaces. An additional Speakon can be used as a single stereo pair for long speaker runs, as a bridged mono speaker output or for bi-amping speakers with a crossover.

List price is expected to be \$2,798 (a lot less than an MX missile, I might add) and the unit will be available for September delivery.

Circle (100) on Rapid Facts Card

Zounds — what sounds

Dynamic Range is the first volume of a new digitally recorded sound effects library called Sonic Boom. Each Sonic Boom volume will concentrate on one type of effect and its variations. This first volume consists entirely of gun sounds and related effects, including 873 sounds from more than 30 weapons. Each effect is categorized and easy to locate.

All of these effects were recorded on DAT, transferred to New England Digital's Synclavier and Direct-To-Disk for trimming, organization and processing, then digitally mastered.

The Sonic Boom series is now available as a 12-inch optical disk to use in the Synclavier and Direct-To-Disk, and on DAT and compact disc.

Circle (102) on Rapid Facts Card

Sound Ideas/LucasFilm library

Also notable in SFX land is the new co-production deal between Sound Ideas of Canada and LucasFilm Ltd. As part of the newest release from Sound Ideas, three CDs of the best stuff from Skywalker Ranch (LucasFilm's Academy Award-winning Marin County, CA, facility) are available. The sounds included in this collection have been heard in many favorite LucasFilm productions and fall into three categories: industry, jungle animals and the sounds of the earth's elements.

At the same time, Sound Ideas is releasing three CDs to enhance its already vast library of sounds. These new discs will feature aircraft, a U.S. Navy aircraft carrier and high-performance vehicle sound effects. (I wonder who got to keep the cars.)

Cutting Edge

Roland SN-550 digital noise eliminator

The SN-550 digital noise eliminator employs a 5-band downward expander, which reduces noise in frequency bands that do not contain the original sound without any of the side effects, such as breathing, encountered on full-band expanders. A hum cancellation circuit efficiently removes ac line noise, display buzz, and noise from dimmers. Many of the unit's parameters are automatically set up to help obtain optimal noise elimination, such as 60Hz ac line noise.

Circle (106) on Rapid Facts Card

Audio Analysts CADD console

This 64-input house console, configured as 40 mic inputs, features a 4-band full parametric EQ section on each channel. Also provided are eight stereo inputs and eight line inputs, all feeding into eight stereo subgroups that feed two stereo mixing

buses. These two buses can then be assigned to one or all of three main P.A. feeds. A companion monitor console is also scheduled for introduction this year.

Circle (109) on Rapid Facts Card

Numark SA3200 power amp

The SA3200 is rated at 510W RMS into 4Ω and 1.02kW into 8Ω (bridged mono mode). The amp incorporates advanced decoupled bipolar technology featuring ultra-speed components for a flat-out frequency response of 20Hz to 20kHz, +0, -1dB. Specs include a slew rating of 50V/ms, a THD of .035%, and a S/N ratio

of 106dB. Other features include a forced air cooling system with a thermostatically controlled 2-speed fan, a current-limiting and fast-tripping circuit breaker power switch, two independent heat sink thermal signal cutoffs and self-resetting dual thermals inside the power transformer, a 5-way binding post to accommodate bare wire and banana plug connections, a bridging switch for mono applications, LED clipping indicators and removable air filters.

Circle (107) on Rapid Facts Card

Shape Mark 10 cassettes

The second generation of Shape's Mark 10 audio cassette incorporates design and production refinements that reduce the number of internal parts while boosting performance. The Generation II retains the clear plastic shell and the "1-piece bridge" assembly introduced as part of the original Mark 10 cassette.

Circle (108) on Rapid Facts Card

Why do Jensen Transformers have Clearer Midrange and Top End?

The high frequency rolloff of a *Jensen Transformer* is optimized, by computer analysis, to fit the *Bessel Low Pass Filter* response. This means *minimum overshoot and ringing* and *flat group delay* for best *time alignment* of all spectral components of the musical waveform.

In other words, the harmonics arrive at the same time as the fundamental frequency.

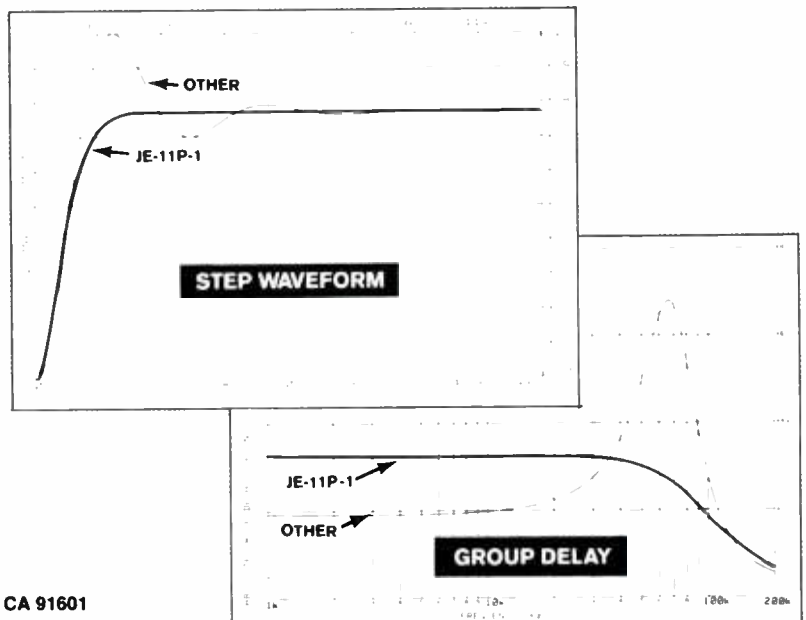

The result is a clear midrange and top end without the harsh, edgy sound which has been one of the most objectionable sonic complaints about transformers.

There's no "midrange smear."

Only *Jensen* has this benefit of hi-tech computer optimization.

Visitors by appointment only. Closed Fridays.

Cutting Edge

quad compressor/limiter contains four compressor/limiters in a single rack space, each with complete function control. The DN510 advanced dual noisegate can be operated as a dual mono system or a stereo unit. The DN514 quad auto gate is a 4-channel noise gate in which each channel has two automatic attack settings for fast setup and attack time response.

Eltekon mass storage systems

Eltekon Technologies has three new products in its line of mass storage systems for samplers, computers and direct-to-disk recording systems. The MX-2 is a rewritable optical disk with a capacity range of 650Mbytes to 1Gbyte on a removable 5 1/4 cartridge. The TX-2 is a tape back-up system with a storage capacity of 2.2Gbyte on one 8mm tape, with a data transfer rate at 246Kbytes per second. MicroSound is a direct-to-disk recording system for IBM 386 systems.

Circle (120) on Rapid Facts Card

Panasonic SV-3900 DAT recorder

The SV-3900 Pro-DAT recorder features a fully implemented serial control interface for external remote operation of transport and programming modes that require few front-panel controls. It also has a remote controller with keypad, a horizontal cassette tray, and balanced inputs and outputs.

Circle (129) on Rapid Facts Card

Lexicon MRC application notes

Continuing with the series, "Applications: Tips, Tricks, and Techniques," Lexicon has published four new documents designed to assist users in tapping the power of the Lexicon MIDI Remote Controller. The first

addresses interactive improvisation and alternative performance techniques using the MRC. LXP-5 and a keyboard. The second deals with MIDI, mixing and the MRC. Both documents were written by Thomas Dimuzio. The third and fourth, written by Paul Lehrman, deal with MRC setups for the Kurzweil 1000 synths and Yamaha synths, respectively.

Circle (139) on Rapid Facts Card

Yamaha monitor loudspeaker system

The MS60S monitor speaker system is a compact powered 2-way loudspeaker with an 8-inch low-frequency speaker and a bullet-type high-frequency unit. It has three inputs and a built-in power amplifier. It features YST, which is designed to use a negative output impedance amplifier, yield extended low-frequency response and improve sound quality. Suggested price is \$575.

Passport sequencing book

Craig Anderton's latest publication, *Power Sequencing with Master Tracks Pro/Pro 4*, is now available from Passport and Music Sales Corporation for \$19.95. The book contains 122 "power tips" for those who use the MIDI sequencers to compose and

play music. Also included is information Anderton has assembled from his experience in electronic music. Sections are included that describe the basics of using MIDI, synchronizing sequencers to tape, tips for using MIDI guitar and other alternate controllers, the creative use of continuous controllers and time shifting to free-sequenced music from a "computerized" sound, techniques for automated mixing, sequencer troubleshooting, and the potential hazards of hard disk storage.

Circle (155) on Rapid Facts Card

The Tapeless Directory

Sypha, an independent digital audio consultant firm, has released *The Tapeless Directory*, which provides information on 39 available tapeless digital audio recording/editing systems; 24 systems include detailed presentations. Background information on technology and terminology is included.

BASIC TOOLS

Hammer

Superconductor™

If you record guitars and you don't use a Superconductor™ you're missing a basic tool!

Guitar cables eat up high end. A 15ft cable causes up to a 10db roll off between 4kHz and 20kHz.

The Superconductor's circuitry eliminates this loss. Experience new clarity & brilliance. Get it all on tape!

How To Get The Perfect Mix.

With MAGI II Console Automation Series from J.L. Cooper Electronics.

The mix down process isn't what it used to be. Recording engineers are finding it increasingly difficult to maintain calm, creative control over both the console and the battery of outboard gear. As these demands escalate, the need for console automation is further amplified by the need for perfection. The MAGI II and MAGI III Console Automation Series from J.L. Cooper Electronics are designed to save you time, money and give you the ability to achieve perfection!

Freedom Of Choice

Both MAGI II and MAGI III interface with virtually any console to provide precision SMPTE-locked automation for 8 to 64 channels. The MAGI II is an outboard system for the audio facility preferring "portable" automation that can be moved from desk to desk. The MAGI III is an internally installed system that uses the console's existing faders.

Flexibility & Control

MAGI II memorizes fader, mute and other real time events. These events can be performed in as many passes as you wish, or you can work on the mix one section at a time, or even one track at a time. MAGI II can be used to automate effects sends and sub-groups as well as controlling your outboard effects processors. The MAGI II allows

MAGI II External System

a very complicated mix to be quickly constructed, edited, and refined in real time or off-line with absolute accuracy. In addition, these mixes can be saved to disk for future use.

Fast, Intuitive & Transparent!

Every aspect of MAGI II has been designed for the working engineer. MAGI II features a straight ahead user-interface incorporating clean, uncluttered moving fader graphics that make it extremely easy to learn and use. Even a "guest engineer" can be up and running in 15 minutes!

MAGI II and MAGI III Features:

Both the MAGI II and MAGI III feature high quality dbx VCAs for audio transparency. The MAGI II Controller reads and generates all SMPTE formats. The powerful software program runs on either a Macintosh or Atari computer.

Mixes may be performed and edited in real time, or off-line with MAGI II's powerful cue list. Cut, Copy, Paste, Merge, Undo, Redo, and other precise numeric edit decisions are fully supported. Our MIDI Event Generator allows the recording and triggering of all types of MIDI events. Film and Video composers can take advantage of our hit list to spot cues in real time. No other automation system gives you this flexibility!

The Bottom Line

Other manufacturers would like you to believe that an automation system must have a high price tag to be on the cutting edge. The MAGI II dispels that myth. The MAGI system with its wealth of professional features starts at just \$5,000.00, and it works! That's the bottom line.

MAGI is being used in a number of applications from

standard music recording, to film, TV, broadcast, commercial and live sound. MAGI is automating consoles from Trident, Soundcraft, Allen & Heath, Harrison, D & R, Biamp, Neotek, Tascam, DDA, Soundworkshop, Soundtracs, AMEK/TAC and Ramsa.

Guaranteed Satisfaction!

J.L. Cooper Electronics and its Authorized Dealers are confident that once you own MAGI II, you'll never go back to manual mixing again. So confident that we're putting our money where our mouth is. For a limited time, our participating dealers are offering a money back guarantee.* If you're not totally satisfied within 30 days, return the system and they'll refund your money.

With the cost of perfection finally within reach, why wait? Call us today for the location of a dealer in your area. It's time to see what MAGI II can do for your mixes.

The Video

You can preview the MAGI II with our video demonstration. This Video offers a complete overview of the system's operation. It's just \$13.95 and can be charged to your VISA or MasterCard. To order, contact J.L. Cooper Electronics at: **(213) 306-4131.**

JL COOPER ELECTRONICS

Super. Natural. Power.

The JBL/UREI SR Series is an artful achievement in sound reinforcement electronics, putting pro-caliber power amplification into a super small super lightweight package. The 500 watt model, for example, is a mere 2 rack units tall and weighs only 42 pounds.

SR Series circuitry capitalizes on the natural benefits of high-speed complimentary symmetry, giving you an amplifier that naturally cancels distortion and lets every nuance of your music come through.

And, powerful. Responding the instant you need it, the dual 150 watt model 6615, dual 300 watt model 6630 and dual 500 watt model 6650 all come with switch-selectable stereo, dual mono or bridged mono operation. Plus, The SR Series uses an ultra-quiet cooling fan that alters its speed as it senses subtle variations in the heat sink temperature. With a rear-to-front airflow across the components, your racks stay cool while your music heats up.

SR Series Power Amplifiers can be found at your local authorized JBL Professional dealer. Drop by today, give them a good listen and put some super natural JBL power into your sound system.
