If you dream of shooting 10-bit 4:2:2 master quality but believe you can't afford it, the new AG-HPX300 P2 HD camcorder changes your dreams into reality. With a \$10,700 list price, the HPX300 is the world's first affordable 10-bit 4:2:2 camcorder. And there's nothing even close. With a standard 17X interchangeable lens and newly-developed three 1/3" 2.2 megapixel 3-MOS imagers, you can record 1080 and 720 HD as well as SD content using master-quality AVC-Intra, DVCPRO HD, DVCPRO50, DVCPRO and DV compression — all with the benefit of P2's faster, independent frame, file-based workflow. As rich in creative features as it is in style, the HPX300's innovative, low profile, shoulder-mount design lets you shoot freely through a beautiful, master-quality world. It's no longer a dream. The HPX300 is here.

APRIL FREEZEFRAME QUESTION

Configuring today's broadcast equipment often requires setting up networks. Part of that task involves creating subnets, or partitioning networks into smaller segments. These subnets are created through subnet masks, which indicate what bits in the IP address can be used to represent the subnet portion of an IP address.

Create the subnet mask required for a router-to-router link shown below for two host addresses in a class B network.

Answer on page 8.

ON THE COVER:

Thomson Grass Valley's new Kayenne switcher offers broadcasters 1.5 to 4.5 M/E and will be shown for the first time at NAB 2009.

Blackmagicdesign

**NEW 4:4:4
MODEL!**

NOW FOR CS4!

New DeckLink HD Extreme has Dual Link 4:4:4/4:2:2 SDI, HDMI and analog connections in SD, HD and 2K!

The new DeckLink HD Extreme is the world's most advanced capture card! With a huge range of video and audio connections plus a hardware down converter, and Dual Link 4:4:4/4:2:2 3 Gb/s SDI, advanced editing systems for Microsoft Windows™ and Apple Mac OS X™ are now even more affordable!

Connect to any Deck, Camera or Monitor

DeckLink HD Extreme is the only capture card that features Dual Link 3 Gb/s SDI, HDMI, component analog, NTSC, PAL and S-Video for capture and playback in SD, HD or 2K. Also included is 2 ch XLR AES/EBU audio and 2 ch balanced XLR analog audio. Connect to HDCAM SR, HDCAM, Digital Betacam, Betacam SP, HDV cameras, big-screen TVs and more.

Hardware Down Conversion

If you've ever wanted to monitor in both HD and SD while you work, then you'll love the built in high quality down converter. Use the Dual Link SDI outputs as a simultaneous HD and SD output, or you can switch back to Dual Link 4:4:4 when working in the highest quality RGB workflows. Select between letterbox, anamorphic 16:9 and even center cut 4:3 down conversion styles!

Advanced 3 Gb/s SDI Technology

With exciting new 3 Gb/s SDI connections, DeckLink HD Extreme allows twice the SDI data rate of normal HD-SDI, while also connecting to all your HD-SDI and SD-SDI equipment. Use 3 Gb/s SDI for 2K and edit your latest feature film using real time 2048 x 1556 2K resolution capture and playback!

Microsoft Windows or Apple Mac OS X

DeckLink HD Extreme is fully compatible with Apple Final Cut Pro™, Adobe Premiere Pro™, Adobe After Effects™, Adobe Photoshop™, Fusion™ and any DirectShow™ or QuickTime™ based software. DeckLink HD Extreme instantly switches between feature film resolution 2K, 1080HD, 720HD, NTSC and PAL for worldwide compatibility.

APRIL FREEZEFRAME ANSWER

Like an IP network address, a subnet mask is a 32-bit binary number. The bits of the subnet mask are arranged in a pattern that reveals the subnet ID of the IP address to which the mask is associated. Using a table, see that 14 host bits are required for this class B network. Therefore, we'll need three octets, plus the six most significant bit positions from the fourth octet to create the mask. The decimal equivalent for the six MSB positions is $128+64+32+8+4 = 252$. The subnet mask is therefore 255.255.255.252.

Question and answer adapted from "Networking," Second Edition, by Jeffrey S. Beasley, printed by Pearson-Prentice-Hall. Available from your favorite bookstore.

Beauty on the outside. Beast on the inside.

It's easy to be enticed by the alluring good looks of the Niagara® 7500 – the newest HD streaming solution from ViewCast. On the outside, its sleek, innovative design and responsive touch-control interface will excite you. Its brilliant high-resolution HD display will dazzle you. But on the inside, it's a beast.

The Niagara 7500 devours your HD video and easily transforms it into high-quality streams for delivery to IP and mobile networks. Its powerful video pre-processing features streamline and simplify your workflow. Inverse telecine, closed caption extraction and rendering, de-interlacing, scaling, cropping and bitmap overlay are just a few of its standard features.

You can switch on-the-fly between HD or SD video, and with ViewCast's SimulStream® technology, you've got the power to stream simultaneously in multiple formats, bit rates and resolutions from a single SDI video source.

The Niagara 7500 from ViewCast. Beauty on the outside... a beast on the inside.

Speak with one of our streaming experts today at **800-540-4119**, or visit us on the Web at viewcast.com to learn more.

It's not easy being green

It's been amazing to see the speed with which Al Gore and his minions have been able to convince most of world that the planet's death is just around the corner if we don't "go green."

I'm not opposed to recycling, but I believe it should remain optional and easy to do. Unfortunately, my belief ran into reality when I met the recycle nazi at my local Big Box store.

The company is offering a \$10 "gift certificate" if you bring in an old television or CRT. What I hadn't noticed was the fine print, which requires the consumer to *buy* that gift certificate.

Needless to say, my misunderstanding collided with Bob, the operations manager, who threatened to have me arrested for depositing "toxic waste" on his property. That's when I took the opportunity to remind him that technically, TV sets weren't classified as "toxic waste," but rather "hazardous waste." There is a difference. That's when Bob's head exploded. Fortunately, the management literally dragged Bob off to another part of the store, so I could continue talking with the other staff.

The outcome was fine. I took my two TV sets home and examined the note on the Best Buy Web site. Yep, at the bottom, there is a note that you must *buy* the gift certificate. My mistake was believing an article on CNET that said nothing about having to buy the gift certificate. That article claimed Best Buy was *exchanging* the gift cards for the old televisions. I mistakenly thought the company was

acting in the planet's interest and using the gift cards as an advertising gimmick. Silly me!

OK, I misunderstood, and after verifying the rules, which are not obvious, I simply took the TV sets to another Best Buy store. Those employees were polite, and I purchased two "gift cards." Trust me, though, I won't use those gift cards to buy any TV sets from Best Buy.

Recycling is one of those things that you're either really into or not at all, and this is where Penn and Teller come in. They produced a program analyzing the costs and benefits of recycling. Ultimately, their research showed that much of the benefit claimed by recycling fanatics is untrue, or, as Penn says, "BS."

There is a way in which advocates on both sides of this issue can win. That's when manufacturers agree to take back old products when new ones are purchased. I know that Thomson Grass Valley has such a policy where if, for instance, you buy a new GV switcher, the company will take back your old GV switcher at no charge and have it properly recycled.

It's this kind of cooperation between buyer and seller we need in both professional and consumer spaces. People will take steps to help maintain our planet's environment when recycling is easy and doesn't cost anything.

So, whether it's a TV set or a production switcher, consider the benefits of recycling. You'll feel good about it when you're done. However, don't expect today's process to be easy or free. It seems there's a "gotcha" everywhere you go. Murphy is always waiting in the wings, no matter your good intentions.

Fortunately, experience says that 95 percent of the bad things you think might happen, never happen. That means if you focus on the 5 percent of things that could happen, you'll be better prepared. Best of all, you probably won't have to deal with Bob.

NVISION

Rethink enterprise class routing

Now that NVISION Inc. is part of Miranda, we can offer NVISION enterprise class routers. Simply put, they provide absolute dependability, with power supply, controller, and crosspoint redundancy. They're fully scalable to 1152 x 1152, using 3Gbps (1080p/3D) and HD/SD/ASI. More importantly, they offer rich integration with our interfacing, master control and monitoring systems. It's time to rethink what's possible.

Rethink what's possible

Wasteful spending

Dear editor:

I just pulled the February issue from my mailbox and read your editorial, "The \$650 million DTV converter box." Here's my reaction: Yes! Yes! Yes! Yes! Yes!

Thank you, Brad, for shedding some light on a tiny corner of this gargantuan catastrophe and for speaking out against it. What a mess! This is definitely a case where the cure is worse than the disease. I just hope we can survive it. And I'm not talking about the recession/depression; I'm talking about the recovery plan.

Thanks for not being afraid to contradict big brother. I wish we could place clones of you throughout the media.

Jeff Perry

A new fan of Brad Dick

HD over triax

Dear editor:

I am currently writing a final year dissertation for Television Production (BSc Hons) on outside broadcast, and one section of the project covers signal feeds from video through to audio. Below is an excerpt from the "High definition over triax" article that was written by Robert P. Seidel of CBS and published in your August 2003 issue:

"Connecting the cameras to the OB truck is achieved through the use

of a triax cable, or fiber-optic cable is sometimes used for a high-definition feed. Triax cable is composed of two insulated copper wires, which the data signals from the camera are sent along to the CCU and additionally power is also sent to the camera. Although high-definition signals can be sent along a triax wire, there are several issues that arise due to the fact that it was not originally designed to carry the high-bandwidth signal of a HD feed. However, the earlier need for a cable that would support super

slo mo filming sent from a standard-definition cable that used a large amount of data means that HD feeds are just about able to fit into a triax cable's limit. Some problems have been posed by this which were brought to light when CBS tested sending HD signals over triax in 2002. The issues reported included nonsymmetrical overshoots on rising and falling edges, excessive ringing following transitions and unequal color component delays on the order of 25ns."

I would be grateful if you could explain the following terms: "nonsymmetrical overshoots on rising and falling edges" and "excessive ringing." I understand the color component delays to an extent as the red part of the signal showing at the top of the screen in the tests due to the delay of information. However, I am not fully sure about what the other two phrases mean and would not want to assume their definition. Thank you for your time, and I await your reply.

James Rice

*University of Central Lancashire
England*

Robert P. Seidel responds:

Thank you for your interest in my article. The term "nonsymmetrical overshoots on rising and falling edges" means that the transition from peak black to peak white is not producing a square wave function, which softens the sharpness of the image's edge. The undershoot from peak white to peak black is not the same shape as the overshoot, which means the transmission system is not linear.

"Excessive ringing" means that after a transition from, say, white to black, the black video just after the transition will vary in amplitude. In other words, it will not be black, but rather varying shades of black. This has the effect of reducing the sharpness of the image.

Good luck with your dissertation!

UGC and local media

Set up user-generated content on your Web site to open up new revenue streams.

BY TIMUR YARNALL

With the explosion in user-generated content (UGC) over the past few years, it's hard to believe that YouTube is just four years old. Remember that hardly any coverage of Hurricane Katrina came in from user-generated video. The coverage consisted of cable and TV personalities and their crews. That has all changed with shocking speed in the past two years and, coupled with the economic recession that has punished traditional media, it's never been more critical for local broadcasters to have a strong UGC strategy and implementation that leads to new revenue streams. From a system architecture perspective, the workflow for working with UGC is not much different than working with station-generated content on your Web site. The overall workflow in Figure 1 on page 16 tends to apply to both content processes.

How to set up UGC

The key baseline requirements in each area of the workflow are:

- *Capture.* Rather than capturing video content from a station broadcast in one format, any UGC solution must be capable of ingesting content (or rather, having content uploaded to it by users) from a variety of devices (users' computers, mobile devices, handheld cameras) and in a variety of formats (MPEG, JPEG, QuickTime, Flash, WMV, etc.).
- *Review.* While station-generated content typically doesn't need to be screened for pornography, copyright infringement or obscenity, it's vital that your UGC solution provide a mechanism for any uploaded content to be screened both prior to and after publishing. It's also important that station staff and the user community on your Web site can re-

port and reject objectionable content. (There are some technology-based solutions that provide for a high degree of screening, but none are yet at the level where human review is not required.)

- *Edit.* This consists of the ability to trim down any submissions to only

It's never been more critical for local broadcasters to have a strong UGC strategy.

the pertinent content. For the purposes of protecting against copyright infringement or payment of royalty fees, this must also include the ability to strip out any music associated with a video submission if it's not clear that the music was independently created. While YouTube may have millions of dollars to fight royalty lawsuits, my guess is that most who are reading this article do not.

- *Encode.* Once content has been approved and has been edited, it should be encoded into your preferred streaming format. I strongly recommend Flash-based video streaming as it has by far the highest usage, though a minority of UGC solutions have adopted Microsoft's Silverlight. Note that some solutions may take the encoding step just after the capture/ingest stage. This is a perfectly valid setup, but leads to higher use of system resources and bandwidth.

- *Publish (generate revenue).* With the UGC encoded and ready to publish to your site, appropriate ads should be included with the content during the publishing process. Monetization of UGC is by no means a mature process, but generally the same advertising

Introducing the Next Generation of Broadcast

Ready or not, the future of broadcast is here. That means delivering high-quality multichannel content to TVs, computers, mobile phones, and more. This demands a flexible, highly efficient codec, one that also promises exceptional reliability and compatibility. Enter Dolby® Pulse, the ideal HE AAC solution for bandwidth-critical services like next-generation HDTV, IPTV, cable, and satellite. It combines the advanced bit-rate efficiencies of HE AAC with support for Dolby metadata. Look for its implementation throughout the broadcast chain, from hardware and OEM products to licensed encoder and decoder solutions. When every bit counts, Dolby Pulse delivers.

formats you'd use on your station Web site and on your mobile solution are appropriate here. These ad formats generally fall into three main categories: contextual ads (such as Google's AdSense), display/banner ads and in-stream video ads (such as preroll or overlay ads).

- *Archive (and potential syndication).* The importance of storing both your station-generated Web content and user-generated content in perpetuity can't be overstated; it's absolutely essential in terms of driving increased

YouNews UGC widget with text link sponsorship for SEO purposes

traffic, user engagement and revenue to your site. Creating a premium local video archive of the best professionally generated and user-generated video for your market should be the goal — something like a local version of YouTube. Virtually all of the primary UGC solution providers will enable you to store your published video in perpetuity at no additional storage cost, and services such as Amazon's S3 offer "storage in the cloud" at rates as low as 16 cents per GB. The creation of this long-term archive, and the possibility to syndicate this content out to multiple sources on an ad revenue share or license-fee basis, is often referred to as long-tail monetization.

Revenue/monetization strategies for UGC

Think local when determining how to generate revenue from a UGC channel on your site. Local CPMs are far outpacing national CPMs, and local advertisers will place a value on your brand and editorial direction that a national buyer never will. In some cases, local CPMs have outpaced national CPMs by 10X.

I strongly believe in selling what we refer to internally as "flat-fee sponsorships on a capped-impression basis." This means that your team should sell UGC (and Web site) inventory on a flat sponsorship basis, but with a firm limit of how many ad impressions

that sponsor will get. For example, you might charge a local sponsor \$15,000 per month for the following:

- Exclusive sponsorship of one of your UGC channels. Let's say, for example, you're running a Cutest Pets contest that month, and the advertiser is the exclusive local sponsor of that channel online.
- A 300 x 250 display ad above the fold on all Cutest Pets pages — up to 1 million impressions.
- A simple text link on Cutest Pets pages that links out to

the sponsor's business Web site. This is helpful for the sponsor's Search Engine Optimization (SEO) rankings.

- A 15-second preroll ad on all Cutest Pets videos that are submitted — up to 100,000 impressions.
- An optional on-air visual banner or short mention in any on-air spots that promote the contest.
- If the impression levels listed above are met, the station will traffic national ads as backfill for the added impressions. Note: This is critical, as if you don't put this impression cap in place and a Cutest Pet video goes viral, you may end up having a huge video bandwidth bill on your hands with no additional revenue. Having the impression cap and right to run backfill in place protects the station and allows you to generate more revenue.

If you do the math on this sponsorship package, the sponsor is paying \$10 cost per thousand (CPM) on the combination of the display ad and text ad, and \$50 CPM on the video pre-roll ad. These CPM levels are healthy enough that, as you continue to promote your site and grow traffic through a combination of UGC and station-generated content, you'll have a strong business and outlook for years to come.

New DTV rules

The FCC has limited pre-June 12 terminations and requires new outreach efforts.

BY ANNE GOODWIN CRUMP

In the wake of Congress' decision to postpone the mandatory DTV transition until June 12, the FCC in March issued a third report and order on reconsideration (third R&O) adopting new rules to govern the extended DTV transition.

While some of the rule changes were necessary simply to assure that the commission's rules reflect the new national transition date, others appear to arise from the commission's continuing concern about the public's readiness for the transition and its desire to discourage early transition.

Transition rule changes

Among the changes imposed by the third R&O were the following:

Dateline

- June 1 is the deadline for TV stations in Michigan and Ohio to file their biennial ownership reports.
- June 1 is the deadline for TV stations and Class A stations in the following states and territories to place their 2009 EEO public file reports in their public files and post them on their Web sites: Arizona, Idaho, Maryland, Michigan, Nevada, New Mexico, Ohio, Utah, Virginia, Washington, D.C., West Virginia and Wyoming. LPTV stations originating programming in these states, which are not required to have public files, must post these reports on their Web sites and keep them in their station records.
- Also on June 1, TV stations (except Class A stations) in Michigan and Ohio, with five or more full-time employees, must electronically file an EEO midterm report using FCC Form 397.

- Stations that have not yet terminated analog operation were required to file a legally binding notice no later than March 17 advising the commission of the specific date and time that the station intends to cease analog operations. A viewer contact number and choice of whether to participate in the analog "nightlight" program also were required.

- No station would be permitted to shut down analog operation prior to April 16, except noncommercial stations certifying financial hardship.
- Stations that have not already terminated analog service were required to file an updated Form 387 (DTV Transition Status Report) by April 16.
- The analog "nightlight" program has been extended to July 12 (i.e., 30 days after the national transition date), and any station that chose to participate must do so for at least two weeks.

Consumer education rule changes

Some of the new education measures adopted by the commission include:

- Stations that made the transition early, unless they are participating in phased transition, were allowed to discontinue consumer education announcements.
- Option 1 stations are required to continue broadcasting educational announcements at the same level that they were immediately prior to the formerly scheduled transition date.
- Option 2 stations will need to air a 60-day rather than 100-day countdown to the date that the particular station will make the transition.
- All stations must add to their current consumer education announce-

ments information concerning: antennas and, if applicable, possible VHF/UHF change issues; the need periodically to use the rescan function on receivers or converter boxes; and the location and operating hours of walk-in DTV help centers in the market area, the FCC Call Center telephone number and TTY number, and the number the station has designated

Option 2 stations need to air a 60-day rather than 100-day countdown to the date.

for receiving consumer calls. The new material must run at least once a day, must air in primetime at least three times a week, and must be at least 15 seconds long.

- Stations that will lose at least 2 percent of their analog Grade B population, whether or not offset by population gains elsewhere, must air service loss PSAs to describe the general area that will lose service, with these PSAs in addition to other efforts.
- Major network affiliates proposing early termination were required either to certify that 90 percent of their service area population would continue to receive analog service until June 12 or engage in substantial additional on-air and market outreach activities. These requirements appear to have succeeded in their goal of discouraging early transition, as only 31 top-four network affiliates will switch early. **BE**

Compression technology

Quantization and transform coding help to assuage artifacts in video.

BY ALDO CUGNINI

Earlier in this column, we looked at various artifacts introduced in the compression process, such as mosquito noise, contouring and blockiness, including basis functions. This month, we'll examine some aspects of quantization in more detail, and look at other artifacts as well.

Block coding, transforms and quantization

Quantization is the process by which continuous analog functions can be represented by a fixed-precision digital system. Typically, video is quantized to 8 bits or 10 bits per each red, green and blue pixel, and audio is quantized to 16 bits per sample per channel. Using fewer bits results in a coarser quantization and increases the visibility (or audibility) of the resulting error, called quantization noise. Figure 1 on page 22 shows an image where each pixel is quantized to 4 bits.

Quantization is carried out in various places in a typical video system, as shown in Figure 2 on page 22. Most video compression systems use transform coding, where blocks of pixels are converted into the frequency representation of the pixels. The most well-known of these transforms is the discrete cosine transform (DCT). Numerically, the DCT is an arrangement of multiplications and additions of the values of all the pixels within a (typically, eight-by-eight) block. Carrying out the DCT results in a new array of values called transform coefficients, and by employing the inverse process at the decoder, the original block of pixels can be reconstructed.

The choice of where to perform the largest quantization will have a huge effect on the perception of artifacts. While the 4-bit linear quantization of pixels would cause noticeable contouring in an image, carrying out the same level of quantization on the

transform coefficients would have a much smaller effect on the image. (See Figure 3 on page 22.) This is because the quantization error of the DCT coefficients will spread the quantization noise over the entire block, avoiding the contouring problem. Of course, at a certain level of quantization, a large enough error in the DC coefficient — which represents the average intensity of the entire block — will cause the edges of the block to mismatch the surrounding blocks, causing “blockiness” artifacts in the image.

However, good encoders will attempt to minimize these mismatches by taking neighboring blocks into consideration and avoiding large discontinuities. Blockiness also results from motion compensation, often causing output blocks to be reconstructed from other parts of the picture, with different detail; although the motion vectors are chosen so as to minimize the absolute error, local differences will always occur at the block boundaries.

In MPEG-4/AVC, a deblocking filter is employed in both the encoder and decoder to decrease blockiness. The filter can be disabled, if desired, because it comes at the expense of additional computational processing in both the encoder and decoder. (In theory, a simplified, noncompliant system could thus be deployed, if it were guaranteed that the transmission would never enable this filter.) The filter is within the encoder prediction loop, so, when used properly, it removes the hard edge of a quantized block while not affecting picture details. The threshold of the deblocking can be adjusted in the encoder, and this setting has different effects depending on video content; some studies suggest that the choice of

Figure 1. Image with 4-bit/pixel quantization

filter parameter is less important with video containing high motion.

Motion artifacts, dirty windows and frozen faces

Another unsightly artifact is the so-called “dirty window” effect, where granules of noise appear to remain stationary, while real objects move beneath them, as if seen through a dirty window. In this case, the encoder may not be allocating enough bits to code the residual (prediction) error in the P (predictive) and B (bidirectionally predictive) pictures, so the error will persist in the decoded image until the next I (intra) reference frame is encountered. “Wavy noise” is a similar artifact that is often seen during slow pans across highly detailed objects, such as people in a crowd. Here, the

Figure 3. Previous image with 4-bit/transform-coefficient quantization

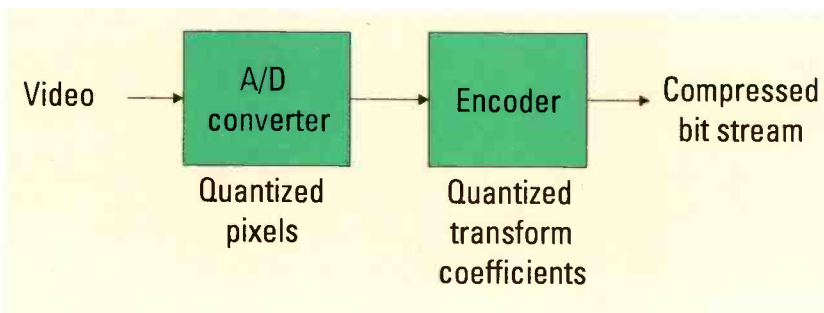

Figure 2. Quantization at various encoding stages

coarsely quantized high-frequency DCT coefficients cause reconstruction errors to move spatially as details shift within the blocks.

An accurate rendition of moving images requires a sufficient bit allocation for both residual data and motion vectors (the elements used to predict the static and moving areas of an image, respectively). If motion vectors are well coded, but not the residuals, we would expect to see objects moving properly, but perhaps with more quantization noise, especially around edges. However, if not enough bits are allocated to motion vectors, and the residuals can't make up for the deficiency, then a “frozen face” artifact could occur, where parts of an object (such as a face) start to move, but the coded image fails to keep up with the motion, making certain parts of the

object appear “stuck” at a previous position. Again, this should correct itself at the next I picture. In the limiting case, if the encoder sets the threshold very high for the “skip macroblock” instruction (i.e., no MV and no residual are transmitted), or there are simply not enough bits to code the macroblock, then the frozen face artifact can occur when the local object motion is small enough that it does not exceed

The UTAH-400 iP Router Gives You the Power.

What you do with it is up to you.

Real-time, on-the-fly control of your Ethernet network. Impossible? Not with the UTAH-400 iP Workgroup Router.

The breakthrough UTAH-400 iP is the Gigabit Ethernet Router for broadcasters. It gives you the power to control your IT infrastructure the same way you've always controlled your broadcast routing — with the push of a button. This patent-pending control method allows you to change port priorities, security groups, and port speed at will. Instantaneously re-allocate bandwidth so that when you need video delivered now, you know it gets there.

The impossible is exactly what you'd expect from Utah Scientific. After all, we've been delivering the most advanced, dynamically controlled switching infrastructures for three decades.

the threshold of the bit allocation budget. We should note that all of these artifacts are exacerbated when the group of pictures — the number of pictures between I frames — is large, because the errors will persist for a long time.

Transcoding

It is often necessary to convert video from one compression system to another, to convert bit rate or resolution within the same compression system, or both. For instance, when broadcast transmissions are carried on cable and satellite systems, the service operator may be taking a pre-encoded feed from the broadcaster. Rather than decode and encode, a higher-quality conversion can be achieved using transcoding. When transcoding an MPEG-2 stream to an MPEG-4 stream, the processor can use the motion vectors already derived in the MPEG-2 encoding as a starting point

for generating the new motion vectors. To achieve higher efficiency, the new output processor can additionally use the enhanced toolkit offered by that compression scheme. Care needs to be taken when either of the compression systems runs at a low bit rate, because artifacts in the upstream video may become worsened by the subsequent transcoding.

Repurposing content from fixed broadcast to mobile receivers will also often require transcoding and bit rate reduction, so similar considerations apply — but viewing on small screens can render many artifacts less visible. An alternative to parallel coding or transcoding content is to code content in a scalable fashion, so simply dropping portions of the coded stream can yield versions of different qualities or resolutions. While possibly streamlining the production process, this approach works best when

the same codec type (e.g., MPEG-4) is used for both decoders. However, when transmission systems multiplex different codec types, simple hierarchical coding is not possible.

Of course, archiving multiple versions of compressed video has storage implications; an alternative is to store only one compressed version and to play out the necessary compressed version(s) with transcoding done in real time. This will require a lot of faith that the end product can be transmitted without any intervening production inspection. However, the sophistication and quality of transcoders may already be at that point — a needed factor given the explosion of various forms of content distribution.

Ready for Primetime

Lowest Cost Per Channel

Outstanding Video Quality

Highest Reliability

Smart Economics

We've done it again — in High Definition!

Five years ago, 360 Systems' Image Servers set a new standard for price and performance, and became the all-time best-seller. Now, we've done it again with our new family of *MAXX High Definition* servers.

MAXX-1200 HD provides three simultaneous video channels, 24 audio channels, and over 70 hours of storage — plus slow-motion, 3-channel key-and-fill, and even remote workstation software.

MAXX-2400 HD provides the power of *four* video outputs, *two* inputs, more than 200 hours of storage, and all the features you expect in a broadcast quality server. Better image quality, multiple audio formats, and smart economics clearly position the MAXX-HD servers as Best of Class. Priced from just \$16,000, they also make very good business sense.

Visit our web site to learn more about MAXX high-definition servers. Or e-mail us at HDservers@360systems.com and request color brochures on the new MAXX-HD family.

BROADCAST

Network addressing

Use this template to start designing your own network.

BY BRAD GILMER

Network addressing is fundamental to all networked professional video facilities, so it is important to have a solid understanding of how it works. There are two distinct environments — the local area network (LAN) and the wide area network (WAN).

Understanding LAN

By definition, the LAN environment is a private network. Internet Engineering Task Force (IETF) RFC 1918 establishes guidelines that should be followed when assigning addresses in private networks. RFC 1918 describes three categories of hosts or computers connected to a network.

Category 1 hosts talk to other computers on the LAN. They do not need to access the Internet for any reason. These devices need IP addresses that are unambiguous within their organization, but they do not need to worry about these IP addresses being duplicated in another organization. An example of hosts in this category are the scanners and cash registers in a supermarket. These devices talk to each other, but there is no reason for them to be visible outside the store.

Category 2 hosts may need access to a limited set of outside services such as e-mail, the Web and FTP. As with Category 1 hosts, these hosts need unambiguous LAN addresses, but the addresses may be duplicated inside another organization. These hosts include the average desktop computer or workstation in your facility.

Category 3 hosts need network layer access outside the organization, and they need globally unambiguous IP addresses. When you think of these hosts, think of FTP servers, Web servers, firewall routers and other computers that need direct WAN access.

When it comes to Category 1 and

Category 2 hosts, they should be assigned private IP addresses from Figure 1 based upon the recommendations in RFC 1918. The fundamental concept established in RFC 1918 is that hosts in these ranges are not uniquely identified on the Internet. In fact, a single IP address in this range will be in use by hundreds, perhaps hundreds of thousands, of computers at the same time. For this reason, RFC 1918 says that private IP addresses are not routable on the Internet. Packets containing these addresses will be dropped at the first WAN router.

Private IP addresses exist because public IP address space is limited; there are only 4,294,967,296 or 2^{32} unique IP addresses available (using IPv4 addressing). There is no reason to assign a globally unique IP address to a supermarket scanner when it never needs to talk to another computer outside the store.

A private network template

In many cases, you will be working with private networks that have already been designed. But what if you are given the task of setting up a private network from scratch? I offer the following as a template to start your

10.0.0.0 to 10.255.255.255
172.16.0.0 to 172.31.255.255
192.168.0.0 to 192.168.255.255

Figure 1. Assign private IP addresses from the range listed in this table in accordance with IETF RFC 1918.

network design. Let's assume that you are designing a network with the following requirements:

- allow controlled access to the Internet for desktops on the private network for FTP, e-mail and Web;
- support a mix of FTP servers, Web servers and other devices that need to

be exposed to the Internet;

- allow LAN hosts to access print servers, photocopier servers and other high-quality imaging devices but do not expose these to the Internet;
- support LAN file and database servers for use within the organization;
- support visiting clients who may have laptops, which they need to connect to the network to access LAN and Internet services via DHCP; and
- provide wireless connectivity via wireless access points.

With this as a starting point, it's time to make a few decisions. First, choose a network address from the 192.168.0.0 through 192.168.255.255 range. For this example, we'll choose 192.168.254.0. IP addresses can be assigned randomly anywhere in the address range from 192.168.254.0 through 192.168.254.255. However, two addresses are reserved. 192.168.254.0 is not available because it refers to the network itself. 192.168.254.255 is unavailable because the highest host address on any network is reserved as a broadcast address. Protocols use this address when they need to send broadcast messages to all hosts on the LAN.

Because computers on this network will be able to access the Internet, we need to pick an address for our firewall/router/gateway. This all-in-one device sits between the LAN and the WAN, allowing LAN devices to access the Internet. Let's put it at 192.168.254.1.

In my February article, I mentioned that the last two addresses on a network — .254 and .255 — were reserved. This is not true. The .255 address is reserved for broadcast traffic as described above. Some network designers put gateway devices at .254, so I try to avoid this address in a network that I did not design myself. But an address ending in .254 is perfectly

Rethink what's possible with one card

Now there's no need for multiple cards for video and audio processing. Our new XVP-3901 delivers all the essential functions on a single module. It offers up/down/cross conversion, with simultaneous 3Gbps/HD and SD outputs. There's also integral fiber I/O, full AFD support, and background keying. Multi-channel audio performance is equally impressive, with advanced processing of 16 embedded and 8 discrete (AES) channels. It's time to rethink what's possible.

Rethink what's possible

www.miranda.com/xvp

Address range	Use
192.168.254.0	Reserved — network address
192.168.254.1	Gateway router
192.168.254.2-192.168.254.32	Fixed IP addresses
192.168.254.33-192.168.254.223	DHCP pool
192.168.254.224-192.168.254.254	Print servers/wireless access points
192.168.254.255	Reserved — broadcast address
255.255.255.0	Subnet mask for all computers

Table 1. Address assignments to use as a template design for a private network

valid. However, my personal preference is to put my gateway device at the first valid address on the network.

This leaves the addresses from 192.168.254.2 through 192.168.254.254 inclusive available for other computers. While we could just start at .2 and begin assigning addresses at random, I prefer a little more organization to my network addressing schemes. Given that we need to support both assigned IP addresses and DHCP automatically assigned ad-

resses, I like to put the pool of fixed addresses low in the network and use them for servers and other devices that need hard-assigned addresses on the LAN. Let's use 192.168.254.1 through 192.168.254.32 for this purpose. Then establish a DHCP pool from 192.168.254.33 through 192.168.254.223. Finally, assign print devices and wireless access points to fixed IP addresses in the range from 192.168.254.224 through 192.168.254.254. Table 1 shows our

final network assignments.

Figure 2 shows a concrete example of how this template could be deployed in a facility. In this example, the address assigned to the facility by our Internet Service Provider is 63.224.5.91. The only device using this address is the firewall router. Everything else is behind the router. Per Table 1, we have assigned the firewall router a LAN IP address of 192.168.254.1. Several servers require fixed IP addresses on our WAN. These include two Web servers, an e-mail server and an FTP server. We have grouped these servers together and left space for additional growth. For example, 192.168.254.2 was assigned to the first e-mail server. We have left a gap and added two Web servers at 192.168.254.11 and .12. This leaves room after the existing e-mail server address for additional e-mail servers as the organization

Content distribution networks

Consider these 10 things when moving files.

BY TOM OHANIAN

The media and entertainment industry is in the midst of an enormous transition. Business models are constantly being evaluated, and new services are being offered. Large media conglomerates are implementing media 360 programs, where content is made available on multiple distribution venues (e.g. terrestrial TV, satellite, broadband, mobile, etc.) and devices. IPTV initiatives are well underway, and the worldwide movement for being connected via broadband is progressing rapidly.

Because of these new business initiatives, there is an explosion of digital content, file formats, content

transformation, platform-specific packaging and the incessant need to get content to so many places in ever-decreasing amounts of time.

File-based workflows and digital distribution

To address these new and continually-changing business models, content creators and manufacturers are adopting file-based workflows. Content must be in the proper format, in the proper location, and with proper essence and metadata so that it can be appropriately consumed, regardless of the listening/viewing device being employed. In practice, the media and entertainment industry is well

underway in its transition to digital file-based acquisition, manipulation (editing, etc.) and distribution strategies. An ever-increasing amount of digital files are being generated, packaged and distributed, and much of this electronic distribution is occurring using the open Internet.

Because time is a huge factor in being able to generate and distribute files, file transfer protocols and file acceleration methods are being examined and adopted. It is important to understand how file transfer methods operate and what functionality to be mindful of when researching methods to move files within a digital media distribution strategy.

Moving files?

Digital files, especially large digital media files like HD ones, need to move in the most efficient way possible. WAN optimization technology can help, but file acceleration alone does not solve the problem. There are many other components that should be considered.

Files must be secure, the integrity of the data has to be maintained, assets must be tracked and verified that they were sent and received, and a variety of integration points with editing, transcoding and playout systems must be supported.

With all these moving parts to think about when developing a digital media distribution strategy, the following checklist should be considered before moving forward:

- *File acceleration techniques.* There are two fundamental approaches to WAN acceleration. One technique is to minimize data via compression, and the other is to minimize round-trip delays that are caused by network

side, Huffman encoding is typically used for text files. Run-length encoding is used for data exhibiting consistent patterns. Network comparisons, or differential transfers, is another method that can reduce the amount of data needing to be sent because it first checks to see what already exists on the target side.

- *Industry standard client connectivity.* By using standard methods of connecting clients to clients, clients to

among other things. The firewall must interpret the FTP protocol, determine which TCP ports are being used and dynamically alter the firewall rules.

Many organizations employ FTP servers in order to facilitate business-to-business transactions. There are certainly a number of issues with this — among them, the inability to resume from where a file transfer was interrupted as well as the issues related to scaling the operation to large numbers

Large media conglomerates are implementing media 360 programs, where content is made available on multiple distribution venues and devices.

server, and server to server, the benefits of IT commodity extend beyond the distribution system. Other systems and applications are able to use a standard, common interface.

- *Data confidentiality and data integrity.*

Data confidentiality refers to the securing of content so that it is not at risk of being pirated or “snooped” in transit. This differs from data integrity, which refers to the verification that the actual data that is sent is identical to the data received. This is especially important for corporate governance requirements.

- *Authentication of users.* The presence of a certificate authority and proper implementation is a means of exchanging public/private

of users. Low-end firewalls and filtering routers are not designed to implement adequate controls on FTP traffic. With respect to the protocol methodology in highly latent networks, round-trip delays are often introduced, causing transfer times to increase.

- *Automation of basic tasks, batch processing.* Once files are being moved as efficiently as possible, it is necessary to interface and interoperate with other applications that represent the desired workflow. Files often have to be modified in some way during the creative process. Changes may involve both the essence and the metadata. File types often have to be changed, file names often have to be normalized, and individuals and groups need to be notified that new content has arrived and is available.

- *Centralized management vs. federated transfer model.* There is a fundamental difference between the two, and the choice of whether to use one or the other must be addressed prior to deciding what file transfer protocols should be implemented. In a centrally-managed model, the precise amount of bandwidth for any file transfer can be set and deterministically adjusted on the fly without affecting other transfers — forming a business-based policy prioritization. In addition, centrally

key strings to ensure that senders and receivers are bona fide members of the intended distribution network.

- *Access control — specific directories, firewall ports.* Transmission control protocol (TCP) is the connection-oriented protocol built on top of Internet Protocol (IP). Each TCP stream is identified by a source and destination IP address/port pair. Firewalls filter IP traffic using port information,

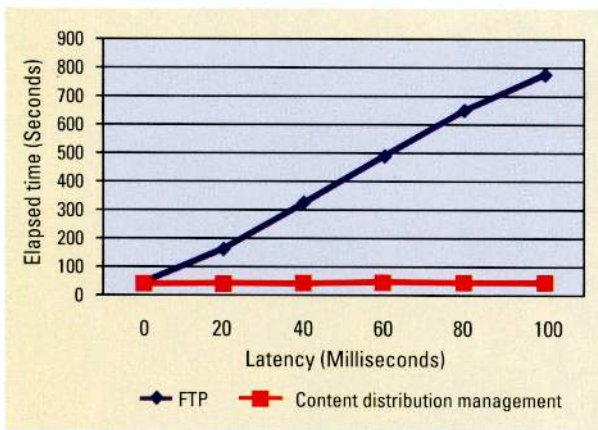

Figure 2. FTP vs. content distribution network on 100Mb/s network

latency. (See Figure 1 on page 30 and Figure 2.) With compression, users will see improvements when network capacity is relatively small. Even so, network latency is the main issue for large pipes. Further, digital media files typically do not benefit from additional data compression techniques.

There are generic data compression techniques and data-specific techniques. On the generic compression

You want it all?

No problem.

Meet the FS1—a 1RU Universal HD/SD Audio/Video Frame Synchronizer and Converter.

It's a multiformat world, and the new FS1 brings it all together...at a breakthrough price.

Turn SD into HD, HD into SD, or HD 1080 into 720 (and vice versa), with FS1's hardware-based 10-bit up/down/cross-conversion.

Embed and disembed audio.

Mate analog and digital. Video. Audio. HD captioning. Whatever.

FS1 not only interfaces to all of your equipment, but also with your facility via its LAN-based web-server and SNMP monitoring. Push a button, or talk to it from across the web.

Put FS1 in the middle of your facility, and see how it makes nice with your gear, your multiformat needs, your engineers...and your budget.

FS1 rear panel

VIDEO SYSTEMS

managed transfers are much easier to control, secure and audit for access logs and download patterns.

• *Auditing access logs and download patterns.* It may seem simple, but the ability to audit user access, control different levels of access and analyze download patterns may not always be available. However, these features are strongly suggested because they create

a controlled environment that can be monitored and tracked clearly.

• *Cross-platform support.* There also exists a requirement to support multiple platforms and operating systems. For example, it is common to run a content creation application on Macintosh OS X, submit that content to a compositing application running on Linux, and then submit the final content to

a transcoding application running on a Windows platform. These multiple platforms require that the distribution system software support multiple operating systems and platforms.

There are two fundamental approaches to WAN acceleration. One is to minimize data via compression, and the other is to minimize round-trip delays caused by latency.

Performance you can build on

Middle Atlantic Products equipment mounting solutions are the strong foundation you need to build effective and reliable broadcast systems. Every Middle Atlantic Rack system includes provisions for all four of the critical support functions needed for professional installations:

- Structural Support
- Power Distribution & Management
- Thermal Management
- Cable Management

Together, these functions support your broadcast equipment to ensure maximum reliability and life.

Professional broadcasters such as Fox, Turner, and many others rely on Middle Atlantic mounting systems for their networks – contact us today and learn how our supporting role can help you deliver your best performances.

Rack models available for high density installations and small locations

Space-saving rack models pull out to provide rear access in cramped spaces

Integrated cable management support for cooling airflow and easy changes

High-powered cooling options are available for the most difficult thermal management challenges

EXCEPTIONAL SUPPORT & PROTECTION™
Call us for details 800-266-7225 | middleatlantic.com

Middle Atlantic Products

• *End-to-end security.* By implementing a secure system from source to target and creating a secure network, the actual payload of the data being sent is secured in-transit. Additionally, media encryption can be introduced to encrypt the actual data bits. Through the use of a certificate authority, all data movement can be tracked as data is moved, and a “certified delivery” receipt can be generated and used for electronic affidavits of all content movement.

Conclusion

To address the needs of the media and entertainment industry, a comprehensive study of all ingest, manipulation and distribution requirements of an organization must first be undertaken. The above 10 points can be boiled down to four pillars: automate, secure, manage and accelerate. By following and addressing all the items in this checklist, files can be moved securely and more efficiently, reducing costs associated with moving digital media. This increases control over the movement of files and enhances collaborative creation of content.

White shading

Proper white shading is critical to ensuring high-quality images.

BY JON HAMMARSTROM

The conversion of light into electrical signals involves many processes that can affect image quality. Correct camera alignment helps minimize the impact of these variables. This article examines white shading — a vital function that is often overlooked in camera setup, or even worse, performed by an unqualified operator using less than adequate equipment.

Every camera operator should at least be familiar with basic white shading techniques. For example, overall brightness must be even across the whole image. To be sure, for studio cameras with fixed lenses and shooting in the same controlled environment, white shading will likely need to be checked less frequently than a digital filmmaker on-location

changing lenses frequently. Still, these measurements should be done in a controlled environment on a regular basis.

Electronic error compensation

White shading is defined as the process of electronically compensating for errors in brightness or color, primarily generated by the optical system of the camera. A frequent problem is that the center of the image may appear brighter than the edges. This type of aberration is caused by differences within the camera's optical system components and is more commonly found within older lenses. Differences may also occur when changing from one filter to another.

The basic tools required for white

shading are an HD waveform monitor and an even light source such as the diffuser panel of the DSC Ambi Illuminator. For optimum signal accuracy, it is better to use an HD-SDI output from the camera, but the process can be performed in SD.

White shading measurement

The Ambi Diffuser has a vertically adjustable light source. For maximum precision, measure the light output from the device with a luminance spot meter. Aim the meter at the center of each rectangle, and record luminance and color temperature values in each quadrant. Adjust as required until the light output in each quadrant is as even as possible.

The gain on the camera should be set to 0dB. Also, ensure that the knee and other camera gamma controls are set to off. Position the camera in front of the Ambi Diffuser panel, and zoom in to overshoot in order to use the center of the panel. Ensure the camera lens is set to manual iris mode and the zebra setting is adjusted to 95 percent. The lens aperture of the camera should be adjusted to between f4 and f5.6.

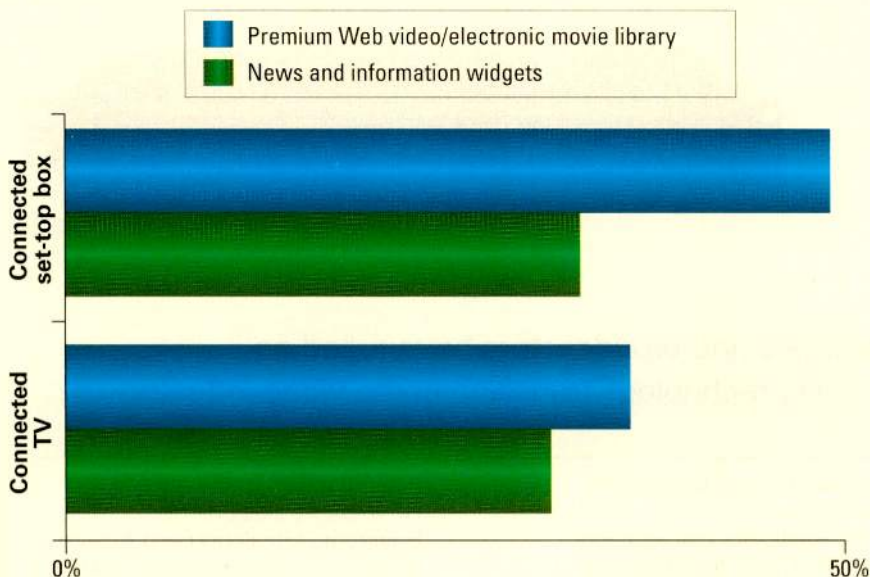

Once the setup is complete, perform a white balance of the camera, and use the light meter and waveform monitor to check that the white balance has been properly performed. The color temperature readout after white balancing should show 3200K, and it may be necessary to adjust the camera's red and blue gain settings. Slightly defocus the lens to further soften any diffusion error. In the shading menu of the camera, adjust the vertical and horizontal saw to 50. The vertical and horizontal pars should be set to zero as a baseline.

Figure 1. RGB display on a waveform monitor

Figure 2. Vector 20X gain of correctly adjusted white-shaded camera

Figure 3. Vector display with incorrectly adjusted output from the camera

Select the monitor mode on the waveform monitor. On the camera, adjust the white shading settings in the following order: green, red and blue. Initially, view just the green channel on the waveform monitor by turning off the other two channels while viewing the RGB display (see Figure 1) and adjusting the H and V saw so that the trace is a flat as possible. Then make adjustments of the H and V par so that the green trace is as flat as possible. Repeat the adjustment process for the red channel and then the blue channel, with each channel showing individually on the display. Once these adjustments are complete, switch to a vector display on the waveform monitor, and adjust the gain to maximum. At this point, a

small circular trace should be visible directly in the center of the display. (See Figure 2.)

On some cameras, it's not possible to adjust RGB shading parameters individually, and an absolute master control is used. In this case, use just the vectorscope display in maximum gain, and adjust the master control until a circular trace is displayed. An oval shape, as shown in Figure 3, indicates that the shading is incorrect. Deviation from the center of the vector display indicates a color cast to the image; the type of hue depends on the angle of the deviation.

Once these adjustments have been completed, store the setup as a new lens file preset. The above procedure can be repeated with different lenses

and filter configurations and saved.

The waveform monitor's diamond display can be used to aid in the adjustment of white balance and camera shading. The diamond display processes the signal in the RGB color space just like the input processing of the camera. When the value of R, G and B are equal, a gray value for the signal is produced. A resulting gray scale camera chart or evenly illuminated white field will therefore produce a vertical line in both the upper and lower diamonds if the camera is correctly aligned. (See Figure 4.) Any deviation can easily be seen with the diamond display.

Conclusion

There are many ways in which a

Can It Be This Easy?

Quality Mobile Broadcasting

Yes! GuideBuilder Mobile allows broadcasters to introduce mobile ATSC services as an extension of their current operations. Integrated mobile DTV metadata management and generation enable transmission of required programming information to mobile ATSC receivers, allowing viewers to select and view channels.

- 1 Integrates smoothly with existing multiplexers, listing services, traffic systems, and automation
- 2 Supports centralized metadata generation for terrestrial and mobile broadcasting
- 3 Enables delivery and display of parental control data
- 4 Allows GuideBuilder users to repurpose existing investment in information and metadata management systems

DIGITAL

www.TriveniDigital.com

We Have the Solution

camera can be erroneously white shaded, just as there are as many ways to incorrectly white balance a camera. White balancing to a piece of paper that has blue spectral tones or uneven lighting is one problem. The same can be said for white shading. The characteristics of the saws and pans in each RGB channel require a perfectly illuminated surface, and any fluctuations in evenness may cause geometric distortions.

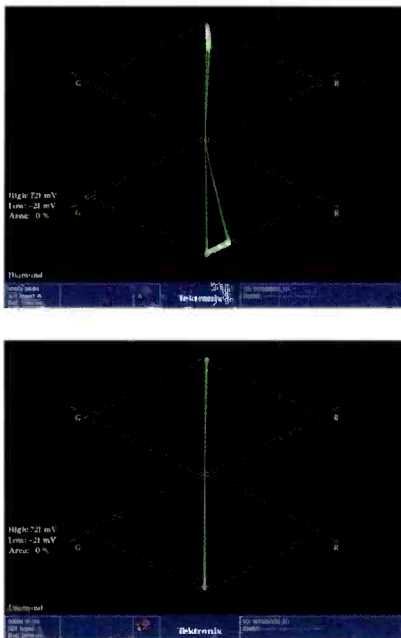

Figure 4. Diamond display with an incorrectly (top) and correctly (bottom) white-balanced camera

By using these techniques to shade and align the camera, and becoming familiar with the correct use of the Ambi Illuminator and waveform monitors, operators can ensure that the image captured by each camera has proper white shading and image quality. The user should also monitor the output of these images from the camera with waveform monitors to ensure that the camera is producing the correct video levels, is properly color aligned and matched to other cameras.

Video over IP

Using low-res video within a facility can save on costs.

ERIC J. PIARD, PH.D.

Video over IP conjures up thoughts of bringing high-resolution video content to the home over the Internet. Bringing this content to viewers is a good thing for broadcasters, but video over IP within the broadcast facility — in a low-resolution format — is another benefit that broadcasters can leverage. Many broadcast functions can be accomplished using non-broadcast-quality, low-res video within a dynamic IT system, compared with doing the same functions using broadcast-quality, high-res video within a static broadcast infrastructure. Here are some things to consider before making the transition.

moves to a file-based workflow.

The availability of low-res video content, associated with an original high-res version, can benefit multiple departments within, and even outside, the broadcast facility. Low-res video is becoming more common in the newsroom, production and master control departments; however, areas such as traffic, program management and promotions are just beginning to realize the value. Certain functions that required access to video monitors or tape machines can now be done in less technical areas of the facility where a ubiquitous IP LAN/WAN connection suffices. For example, certain approval and timing operations

not, correspondingly resulting in files (proxies) or in video streams.

Streams are typically used for monitoring purposes. For example, an off-air signal for one or more channels (one's own or even competitors') may be monitored remotely using a low-bit rate capture, which can be easily displayed at multiple locations within the broadcast facility on standard desktop computers. Alarms can also be sent to relevant personnel or other software components when certain conditions in the stream are detected (e.g., bad or no video and audio). This same stream, additionally, can be recorded for logging purposes to meet certain FCC requirements or

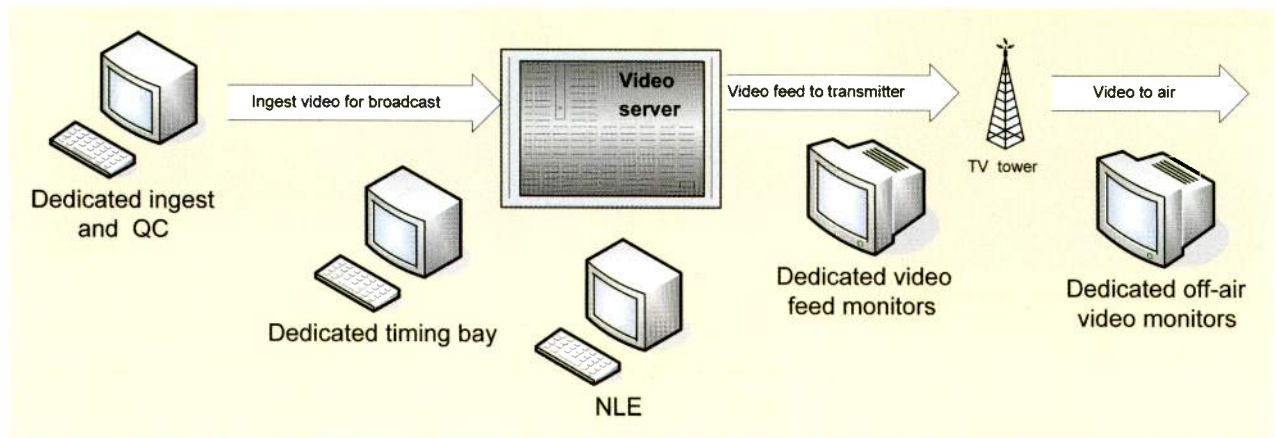

Figure 1. Dedicated, hardwired equipment is expensive, restricts workflows and requires people to work where the video is available.

Low-res video

Until recently, broadcast operators would handle all video content within the broadcast facility in high-res format. This has worked fine but requires a substantial hardware investment and dedicated facilities to transport video for viewing and editing. (See Figure 1.) The ability to do a significant number of broadcast functions using low-bit rate video solutions over IP networks introduces some interesting possibilities to the broadcaster, especially as the industry

(where durations, start and end time code positions are captured) can now be performed within the traffic department instead of the master control/ingest areas. (See Figure 2 on page 42.)

High-res video sources such as baseband (tape, live signal, etc.) and file-based (commercial and program electronic delivery systems) can be captured using current acquisition methods before converting to low-res format. The low-res content, depending on the input source, can either be persisted or

to provide to third parties, replacing expensive and cumbersome tape recording logging systems. Look for solutions that will not overload the network and will scale easily if the number of channels or monitoring stations increases over time.

Low-res proxies

Low-bit rate proxies can be created from baseband video via real-time encoders, in parallel to the high-res ingest ordinarily performed. They can also be produced from existing high-

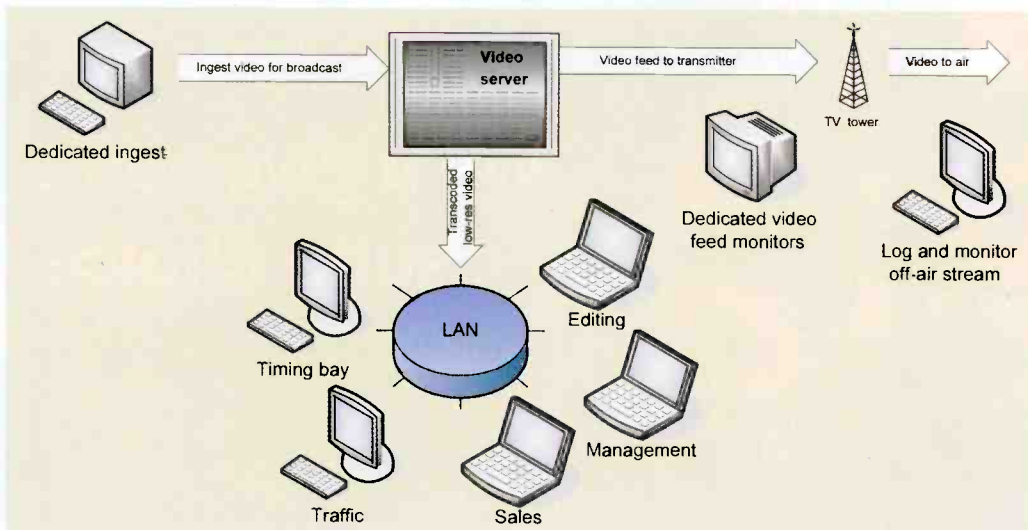

Figure 2. Existing LAN systems can be used to view and time video from any networked PC. Tasks can be redistributed to create fluid, streamlined workflows. Consider the simple task of a sales person who needs to view a spot. Often, it involves traffic and a trip to master control to view the video.

res video files on broadcast video servers via a transcoding operation, potentially faster than real time. High-res files may be the result of prior

standard baseband ingests, but may also appear directly on a video server because commercial, syndicated and in-house content are increasingly

a relatively low-res proxy, whereas browsing as part of a QC approval step may require a high-res proxy. The format of these browsing proxies can

acquired electronically, compared with tape. This proxy generation can be provided by the video server itself, in some cases, or by third-party tools, integrated with other solutions in use within the broadcast facility, such as automation and digital asset management systems.

Access to proxies has various applications, from simple browsing to more complex timing and editing functions. Browsing for the purpose of easily recognizing the original content merely requires

be varied, so standard players, such as Windows Media or QuickTime, can be used. Some browsing functions may require that ancillary data of the source content is also captured — for example, closed-captioning or subtitling data whose existence may need to be verified or potentially extracted as metadata to facilitate future content searches.

Timing and editing

Timing and editing functions, however, require a decent resolution, the guarantee of a 1:1 frame correspondence to the original high-res copy and the ability to identify the time code of each of these frames. For example, timing operations may need to capture accurate SOM and EOM time codes that will be used later for playback to air. An operator may use a proxy to create closed-captioning data files indexed by the time codes

of the frames that will trigger display of the closed-captioning. Or an editor may use the proxy of some raw footage to create a new piece of content, which via an edit decision list will allow a nonlinear editor application, acting on the high-res original copy, to frame-accurately produce a broadcast-ready copy of this new asset.

Other features

Audio also needs to be captured accurately, staying in sync with the video in the original, not just to understand what is said, but, as is necessary in the closed-captioning example, to make sure the captions will appear at the appropriate time. Another useful feature to look for in the capture tool is access to the proxy before the capture is completed. This allows some of those aforementioned functions to be performed nearly as soon as the capture begins — clearly a more ef-

ficient process.

The transcoding method of generating proxies results in multiple versions, so the video content can be repurposed to platforms where low-bit rate formats are commonly used, such as the Web, mobile devices and smartphones, which are potential new revenue streams for broadcasters.

Working effectively and realizing efficient workflows across departments in this low-bit rate world requires proper asset management and handling of associated metadata, facilitating rapid and easy access to the video content. Therefore, broadcasters can see increased cost savings, as well as improvements in their workflows, by transferring a significant portion of their usual daily broadcast video processes to the corresponding low-res world. **BE**

CHARACTER GENERATOR

Compix Media CYNERGY HD

Provides broadcast-quality, dual-channel HD CG for the broadcast, sports, professional, educational and government markets; capable of simultaneously outputting graphics in either SD-SDI or HD-SDI; brands multiple video streams with different overlay material from a single chassis and one easy-to-use interface.

800-589-2555

www.compixmedia.com

Booth: SL5105, SL4805

CLIP PLAYER

Echolab MegaKeyMD

Serves as a storage device for animated graphics and video clips; features playback of two channels of dynamic video that can be either HD or SD; allows the two channels to be controlled together for synchronous fill-and-key output or controlled independently; offers full integration with Echolab's Overture switcher series to support complex animated transitions through the switchers' Stinger feature.

978-715-1020; www.echolab.com

Booth: SU2302

PORTABLE HEADPHONE AMPLIFIER

JK Audio RemoteAmp Three

Provides a listen-only connection for IFB or full-bandwidth audio monitoring; XLR line-level input accepts either a balanced mono signal or a one- or two-channel party-line intercom feed (listen only); the XLR source switch selects between balanced input and intercom monitoring; an integrated speaker is disabled when headphones or earphones are connected.

Brown indicates advertisers

HE AAC CODEC

Dolby Pulse

Uses the HE AAC core originally created by Coding Technologies and adds Dolby metadata capability; the metadata parameters match those in Dolby Digital so broadcasters and program makers can be confident about how their mix will sound, regardless of the broadcast format; fully supported by upstream Dolby products and technologies; provides the capability to broadcast stereo and 5.1-channel audio at the lowest bandwidth rates while maintaining high audio quality; eliminates the need for a stereo simulcast with a 5.1 broadcast, further reducing bandwidth.

415-558-0200; www.dolby.com

On track, on vision

We've always had an eye on the future – a strong vision for where the TV business is going and the technologies it needs to succeed. With our Emmy® award-winning video compression and on-demand solutions, and the latest in content management systems, we've built a strong reputation for keeping our customers firmly on track.

Now as part of the Ericsson group, our vision is deeper and broader as we enable all television service

providers to deliver the Individual TV Experience and generate subscriber and revenue growth with next-generation DTH, IPTV, VOD and personalized advertising solutions.

Our new collection of visionary papers will give you all the information you need to build your individual journey into the future of TV. Share our vision, visit www.tandbergtv.com/vision.

TV ONE'S HD-SDI VIDEO & AUDIO PROCESSORS NOW SHIPPING

TV One's C2-7310 Up/Down/Cross Converter is the first HD video processor that pays just as much attention to audio as to video, offering full SD/HD-SDI audio embedding and extraction plus many other unique processing features.

The superior audio processing capability of the C2-7310 allows the user to mix, route, process, delay and framerate convert any of the incoming 32 stereo audio channels: 8 de-embedded from each of the 2 HD-SDI inputs plus the 16 external AES3-id inputs. A DARS reference input is a standard feature. After processing the audio, 16 stereo channels can be output directly as AES3-id and up to 8 stereo channels embedded into each of the 2 HD-SDI outputs. Because of its dual-channel nature, each of the HD-SDI outputs may contain completely different embedded audio. A variety of A2-7000 series external format converters are available to provide inputs and outputs as AES3-id on BNC (A2-7312), AES3 on XLR (A2-7302) or analog stereo (balanced or unbalanced) on XLR (A2-7342.)

THE AZDEN 1200 SERIES HIGH-PERFORMANCE TRUE-DIVERSITY BROADCAST WIRELESS MICROPHONES IN AN ALL NEW FREQUENCY RANGE

Gold Mount®
1200URX/AB

IDX® "V" Mount
1200URX/VM

1200URX-Si
"Slot-In"

Whether you use a Panasonic® or Ikegami® camera with "slot-in" receiver capabilities, or use the Anton-Bauer® Gold Mount®, or a V-Mount battery, there's an Azden 1200 designed specifically for your use.

The receivers and transmitters include:

- New compander circuit for more natural sound
- Improved frequency response with lower noise levels
- New DTV-compatible (188) frequencies covering 4 UHF TV bands
- True diversity system with 2 complete front-ends and high-gain antennas
- Proprietary Diversity Logic Control circuitry for reduced drop-outs
- Dielectric filters throughout, for improved image rejection and superior diversity isolation
- High 5th-order filters for improved S/N ratio
- Multi-function LCD shows channel, frequency, battery info, AF level, and diversity operation

Transmitters also feature: New circuitry, powered by only 2-"AA" batteries, new plug-in transmitter with 48V phantom power capability

Bodypack transmitter (1200BT) with reduced current-draw for improved battery life, is available with an Azden EX-503H or Sony® ECM 44H lavalier microphone.

Plug-in XLR transmitter (1200XT) works with phantom power.

In the field, you never get a second chance to get it right.

That is where you need the dependability of Telecast Fiber Systems. We pioneered the fiber optic industry, and we have been by your side for over fifteen years providing the products you need every day.

We owe our success to you, your feedback and your ideas. The result is excellent products that help you "get the shot", no matter what.

And that is why we are outstanding in our field, and yours.

MASTER CONTROL AUTOMATION

Florical RemoteAirBoss

Optional module within S.M.A.R.T. Central; enables access to monitor or control on-air playout from any workstation within the network; can control a single channel or simplify centralization of master control, allowing hub location selection based on workflow needs or as workload changes.

352-372-8326
www.florical.com
Booth: SU1802

CAPTURE CARD

Blackmagic Design DeckLink Studio

Features SDI and enhanced analog connections: SDI, analog component, S-video and composite video; has a built-in hardware downconverter and four channels of balanced analog audio, eight channels of SDI audio and two channels of AES/EBU digital with sample-rate converters; enables users to move seamlessly between SD and HD workflows; includes RS-422 deck control and blackburst and trisync reference input.

408-954-0500
www.blackmagic-design.com
Booth: SL10820

CONTENT MANAGEMENT

Front Porch Digital DIVAdirector V4.0

Features key frame and thumbnail support, enabling the addition of visual markers in query results and to better identify segments in shot lists; collaborative shot list support allows users to share viewing and editing of shot lists; virtual asset support enables an asset and its metadata to be added to the system in anticipation of the clip's later arrival in the archive.

303-440-7930
www.fpdigital.com
Booth: SU6117

AUTOMATION SYSTEM

Pebble Beach Systems Neptune

Features floating lists, global timers and multi-time zone support, as well as further expansion of Anchor, the company's integrated media management tool; floating lists allow any channel to be played from any physical playlist, which is then automatically routed to the right output; the system is aware of the available hardware and can determine whether the broadcast equipment can support SD, HD or both.

Booth: SU11402

SYSTEM AND ENERGY MANAGEMENT

TSL MDU12-PMi

Gives the user complete control over and visibility of equipment racks, no matter how geographically disparate their locations; provides remote Ethernet control and monitoring of 12 individually switched IEC outputs via secure Web browser with SNMP and e-mail alarms for fuse fail, power fail, over/undercurrent alarm and power measurement, all alongside 16 GPI inputs; a current-sensing feature monitors the total or individual outlet power consumption, plus the operating temperature of the rack, providing clear warnings if variables rise above or fall below fully programmable limits.

Broadcasters who need the best, turn to Florical

FLORICAL
TV AUTOMATION
SYSTEMS™

Look what's
NEW!
at Florical systems

Featuring at NAB09

Visit us at NAB09 booth SU1802

S.M.A.R.T. Central is a smart client based gateway into our television broadcast automation system. This unique product was introduced at NAB08 and improves three main areas of workflow: 1) reduces redundant tasks, 2) makes systems accessible over a closed network to improve workflow while maintaining a completely secure system and 3) automatically emails critical reports to key personnel to improve communication and response times.

RemoteEditor - NEW! - a module within S.M.A.R.T. Central that allows access to current and future schedules for viewing or editing. As with all of S.M.A.R.T. Central products, RemoteEditor can be accessed from any networked machine so that last minute changes can be made from almost anywhere ... potentially eliminating make-goods.

InventoryBrowser - NEW! - a module within S.M.A.R.T. Central to browse the database and view low resolution copies of server inventory. With the power of smart client technology, the user can log in from any networked machine, whether from a sales laptop in the field or Traffic desktop, and view content that has been dubbed into the broadcast servers. The tool is perfect for Traffic or Sales to view spots from the convenience of their desktop.

AssetDispatcher - NEW! - streamlines central ingest systems. AssetDispatcher is a transfer agent that uses regional distributors and programming settings to push commercial and long-form from a centralized ingest location to regional sites after material has been approved. Timing and all metadata can be entered once and shared by all.

RemoteAirBoss - NEW! - a module within S.M.A.R.T. Central for master control automation that allows access to monitor or control on-air from any workstation within the Florical Network. RemoteAirBoss can be used to control a single channel or can simplify centralization of master control, allowing dynamic selection of "hub" location based on your unique workflow needs or as your workload changes.

AirBoss has a new look. Florical has enhanced the look and user interface, including a new on-screen video feed. Come to our booth at NAB09 to see the look (SU1802).

NAB2009 NEW PRODUCT EXPOSITION

SOFTWARE FOR PRODUCTION CONSOLES

Lawo v4.4 software

For the mc² series production consoles, which includes the mc²90, mc²66 and mc²56; with the Lawo Router MKII, the new software provides a redundant control system that initiates an automatic takeover if an error on the router module/control system occurs; control system redundancy activates if the standby system notices a loss of the connection between both control systems; this can occur as a result of either a software failure or a hardware error in the active control system.

888-810-4468; www.lawo.de

Booth: N5433

SINGLE-MODE HYBRID CABLE

Neutrik

Newest addition to the opticalCON line is a low-voltage camera/single-mode hybrid cable; optimized for camera link systems (ENG/SNG), camera adapter systems, camera cranes and powered down converter boxes for broadcast applications where only ELV (Extra Low Voltage, <50 VAC) is required.

732-901-9488; www.neutrikusa.com

Booth: N7929

CAMERA-MOUNTED DVR

Fast Forward Video Elite HD

Camera-mounted DVR and player harnesses the J2K compression codec for recording HD-SDI video signals; accepts an incoming HD-SDI video signal with eight channels of embedded audio and records at data rates up to 100Mb/s with 4:2:2 sampling and 10-bit quantization at near-lossless compression; records video on commercially available, hot-swappable 2.5in SATA drives.

HDTV ENCODER

NTT Electronics

Encodes 4:2:2 chroma AVC/H.264 HDTV/SDTV real-time, ultra-high quality video; supports MPEG-2 format to enable smooth migration from current MPEG-2 technology to future AVC/H2.64.

+81 42 796 2496
www.nel-world.com
Booth: SU11617, SU11723

CONNECTORS AND CABLES

LEMO

The company has partnered with 3SAE Technologies to offer fusion splicing technology for its fiber-optic HDTV connectors and cables; the technology allows for both factory and on-site termination by replacing the fiber-optic connector polish process with a spliced fiber contact connector; reduces the time and level of expertise required for terminating the LEMO fiber-optic hybrid connectors.

707-206-3776; www.lemo.com
Booth: C7433

DENG WIRELESS CAMERA SYSTEM

Elber WLCT-02SD

Wireless camera transmitter is ideal where portability and mobility is important; can be installed on the camera back without losing the optimum power dissipation; the integrated MPEG-2 4:2:2/4:2:0 digital encoder can accept digital SDI video as well as analog, and up to four mono audio channels or SDI embedded; provides a high-quality digital video and audio signal that can be used with others coming from wired cameras.

is your broadcast operation costing the earth?

iTX - saving you money, saving energy

When did you last think about the environmental impact of your broadcast facility ... or what it costs you in power consumption alone?

Making the move to IT-based technologies delivers lower CAPEX, lower energy consumption, lower OPEX.

It's time to join the iTX revolution.

the future starts here...

itx
 INTELLIGENT TRANSMISSION

IN-RACK AUDIO MONITOR

AEQ AM-04

Accepts four analog audio signals; has two pairs of AES digital audio outputs with additional analog audio signal and SDI video embedded audio signal; acts as a de-embedder; features level alarm, RS-232 port, headphone output and two pairs of tricolor peak VU meters, each with 26 LEDs; provides scales for six types of audio measurements.

+34 916 861 300; www.aeq.es

Booth: N5429

SMART ANTENNA SYSTEM

NSI Quick Shot

An advanced transmit system for mobile operations; reduces setup time by automatically aligning the transmit antenna with the receive location; can be remotely controlled by the NSI MC5; takes the microwave setup activities out of the truck and allows a single operator at the studio to control both ends of the microwave link; incorporates an NSI Silhouette or Stiletto directional antenna and a pan/tilt positioned; existing antennas can be used in some cases.

410-964-8400
www.nsystems.com

Booth: C1715

PAN-TILT CAMERA SYSTEM

Canon BU-50H

Remote-control robotic indoor pan-tilt HD camera system; provides exceptional HD video imagery and versatile performance in such locations as houses of worship, legislative chambers, studio POV camera positions, indoor security areas, and many other environments; an extremely quiet P/T system and features a maximum noise level of NC30.

800-321-4388
www.canonbroadcast.com

Booth: C4325

ENG/SNG FIELD CAMERA INTERFACE

Studio Technologies Live-Link

Features full status LEDs, support for all video formats, two mic/line connections with selectable gain and phantom on/off, two line-level paths for IFB, two-channel auto-nulling intercom, 10/100 Ethernet transport and Anton/Bauer battery adapter.

847-676-9177; www.studio-tech.com

Booth: C11843

TV ANALYZER

Rohde & Schwarz R&S ETL

Performs 8-VSB testing and optional MPEG-2 monitoring; analyzes and generates analog and digital test signals in a single box; allows new TV standards to be implemented on a software and hardware basis; uses real-time demodulation throughout.

410-910-7800
www.rohde-schwarz.com

Booth: C1933

TRANSCODER

TANDBERG Television RX8250

Part of an end-to-end cable HD distribution system that allows content providers to carry six to eight MPEG-4 AVC HDTV channels on a satellite transponder; helps operators with networks that have a large installed base of MPEG-2 HDTV set-top boxes by enabling efficient transcoding of MPEG-4 AVC/DVB-S2 distributed content into high-quality MPEG-2 HD.

678-812-6300; www.tandbergtv.com

Booth: SU5108

STANDARDS CONVERTER

Snell & Wilcox Alchemist Ph.C - HD

Offers simultaneous SD and HD conversion; new features include a FilmTools option, which delivers results with film-like quality quickly and affordably, and a new option for integrated Dolby E audio handling, which simplifies broadcast and post-production workflows and eliminates the need for outboard Dolby decoders and encoders; provides SNMP support.

212-481-2416; www.snellwilcox.com

Booth: SU1917, SU1717

AUTOMATION

Pro-Bel Morpheus

Includes a new scripting capability that allows users to automate repetitive tasks, improving productivity and consistency; anything users do via the user interface is captured within macro code and can then be mapped onto LCD panels; new fast commercial break feature tracks all commercials within a schedule, allows an operator to instantly swap or move them and also provides detailed information on what has been aired.

631-549-5159; www.pro-bel.com

Booth: SU12710

RED ONE HANDLE

Anton/Bauer QR-RH

Enables multiple mounting and the ability to mount the RED drive in various locations; permits users to attach various accessories to the camera's handle via 1/4-20 and 3/8-16 tapped holes; tape hook provides tape measure attachment for camera focus.

203-929-1100; www.antonbauer.com

Booth: C6201

Intelsat, Delivering the First 20 Years of HD

On April 12, 1989, Intelsat delivered the first digital HD transmission between the United States and Japan. Today, Intelsat delivers the brightest stars in news, entertainment and sports through its industry-leading HD neighborhoods. Our partners trust Intelsat to deliver HD content at the highest quality, because with HD, every bit counts.

Professional Show for Audio, Video and Communications

In the broadcasting industry and among its wide-ranging clients, the Inter BEE exhibition has earned a solid reputation as a venue to unveil some of the world's most advanced technologies. Typically visited by creators and engineers at the forefront of fields involving visual, audio and broadcast media, the exhibition serves as both an international technology exchange and an opportunity to cultivate business over a broad spectrum of needs. Inter BEE is an excellent business opportunity for **manufacturers of audio, visual and broadcast equipment.**

We hope you will take full advantage of this exhibition by becoming an exhibitor.

To create a masterpiece,
sometimes it only takes a simple tool.

mc²56 – Performance, pure and simple. A reduced control surface with maximum performance from the system core – these advantages of the latest mixing console from Lawo will really impress you. With the mc²56, not only do you benefit from the well-known highlights of the mc² family – powerful HD core, absolute reliability and innovative features – you also benefit from the console's unprecedented ease of use. The worldwide success of mc² quality, paired with groundbreaking functionality – just two of the features that make an mc²56 the perfect tool for daily broadcasting. MEDIA SERVER SYSTEM

Omneon Spectrum

Enables broadcasters to migrate from analog to digital, tape to disk, SD to HD and from single- to multichannel operations; incorporates open, advanced architecture; includes MediaController, MediaDirector, MediaPort I/O modules, MediaStore storage arrays and SystemManager.

408-585-5000; www.omneon.com

Booth: SU7217

ADJUSTABLE-BEAM FLUORESCENT LUMINAIRES

Videssence Power Key

Feature adjustable mounting yoke and lever at the back fixture to adjust each lamp cell; allows adjustments from 60 degrees to 90 degrees beam spread; reflector refocuses the light without the need for additional accessories; use 55W Biax lamps; P055-155BX is 55W, P110-255BX is 110W and P220-455BX is 220W.

626-579-0943; www.videssence.tv

Booth: C8428

SERVER

360 Systems MAXX-2400 HD

Plays up to four HD video streams at once, or can record two streams, while playing two others; also can be used as a graphics store, with linked key-and-fill capability; standard features include HD-SDI video I/O with frame synchronization for recording wild sources like tape and satellite feeds; audio formats include embedded audio, and your choice of AES/EBU digital or balanced plus four analog.

818-991-0360; www.360systems.com

Booth: N4120

STORAGE

Bycast StorageGRID 8

Virtualizes information retention and access over a range of storage devices from high-performance disk to archival media, distributed over multiple sites; features the new Distributed File System Gateway (DFSG), a high-performance clustered file system front-end; provides a unified solution to manage the storage of digital data and images from primary storage to deep archive.

866-217-6813; www.bycast.com

Booth: SU6925

CONTROL AND MONITORING SYSTEM

Pro-Bel Morpheus Control & Monitoring (MCM)

Seamlessly integrates with systems from two new manufacturers; new MCM routing configurations also offer users the capability to control and monitor more features within the company's recent routers, and to display status at a glance; new features include advances in the rules engine, customer-defined logic functions and a tie-line engine.

631-549-5159; www.pro-bel.com

Booth: SU12710

LCD VIDEO MONITOR

Wohler RM-3270W-2HD

Measures 3RU in height; features two 7in widescreen LCDs, each with 800 x 480 resolution and 16.7 million colors.

510-870-0810; www.wohler.com

Booth: N1102

CABLE ASSEMBLIES

Wireworks BG Cable Assemblies

Can be used in both microphone and line level applications; feature MusiLUX microphone cable or AES/EBU digital cable teamed with Neutrik's convertCON connector; available in four configurations: XLR male to convertCON, XLR female to convertCON, convertCON to convertCON and quarter-inch TRS to convertCON.

908-686-7400; www.wireworks.com

Booth: C4147

VIDEO CONNECTORS

Gepco V-CON

Provide bandwidth and electrical performance necessary for multichannel HD interconnects in a durable, all-weather design; available in three- to six-channel versions as well as 10-, 12- or 14-channel versions; can be used for both component video and high-density, uncompressed HD video applications.

847-795-9555; www.gepco.com

Booth: C7430

ROBOTIC AND MANUAL PEDESTAL

Vinten Radamec Fusion FP188

Recognizes new, compact L-shaped floor targets that offer more precise reference positioning across a wider range of floor finishes; features smoother on-shot transition sequencing and collision avoidance protection; 187lb payload supports an expanded camera/prompter package, including the talent-facing vanity monitor often attached to the head during HD production.

845-268-0100; www.vinten.com

Booth: C6029

SIGNAL SWITCHER

Whirlwind AB-8

Eight-channel, balanced bidirectional switcher auto-senses loss of input on its eight primary inputs; automatically switches to secondary inputs for backup in live tracking applications; can also be used manually to switch between inputs and outputs when multitracking in a studio; channels can be switched individually or globally; AB-8 units can be master/slaved for switching large numbers of channels.

585-663-8820; www.whirlwindusa.com

Booth: C6533

EXTENDER

Avocent LongView 1000P

Separates users up to 1000ft from computers; user PC experience unaffected over distance of 1000ft; extends audio and serial ports; single cable-to-user design simplifies installation and moves; with its dual transmitter, supports connectivity to a second user station.

866-277-1924; www.avocent.com

Booth: SU5417

**Reliable.
Efficient.
Cost-Effective.**

Comtech EF Data has a proven track record of supplying satcom infrastructure equipment to broadcasters in more than 160 countries. By joining forces with Radyne, our broadcast product portfolio is now expanded. The combined Comtech EF Data and Radyne solutions encompass contribution and distribution for a range of broadcast applications.

- Radyne DVB-S2 Modulators offer a robust feature set, powerful coding, flexible interfaces, amplitude and group delay equalization, and proven performance.
- Comtech EF Data IP Encapsulators leverage embedded platforms, the bandwidth efficiencies of DVB-S2 and advanced technologies to provide reliable multi-protocol encapsulation.
- Comtech EF Data Receivers feature redundancy and embedded platforms, facilitating standard data broadcasts and the transport of MPEG-2 video service over IP.

These advanced communication solutions can help you maximize transponder utilization and minimize operating expenses. Contact us to learn more about how our reliable, efficient and cost-effective solutions can be integrated into your broadcast network.

www.cisco.com
Booth: S214LMR, S213LMR

HD WORKFLOW

Avid HD News

An end-to-end HD news system that enables broadcasters to cost-effectively produce HD programming; broadcasters can easily acquire, edit, network, manage assets, playback and control functionality of XDCAM HD (long GOP HD MPEG-2) content with a workflow designed to deliver significant time, storage and bandwidth savings; consists of the new Air-Speed Multi Stream production server version 1.0, NewsCutter software version 7.5, as well as the Interplay Production Asset Management and Unity shared storage systems.

978-640-6789; www.avid.com
Booth: SU902

IP-BASED VIDEO SERVER

Streambox Store and Forward Server

Supports hundreds of simultaneous video file uploads from field crews, stringers and citizen reporters; provides searchable metadata via a Web-based interface; can be customized to facilitate rule-based transcoding to and from a variety of file formats.

206-956-0570
www.streambox.com
Booth: SU14413

MONITORING SYSTEM

Genelec SE DSP

Small Environment DSP monitoring system is designed to solve acoustic problems associated with small recording and mixing environments; combines the SE7261A 10in DSP subwoofer with 8130A digital input active monitors, configurable as a subbass stereo or multichannel reference system.

MULTIVIEWERS

Apantac Tahoma

Series is 3G ready and auto-detects four to 32 video inputs (HD/SD-SDI/composite); support DVI, HDMI and VGA outputs up to 2048 x 1080; include built-in video and audio alarm detection, as well as 16 channels of embedded audio per input with four channels of discrete analog or digital audio; feature built-in Cat X extender.

503-616-3711; www.apantac.com

Booth: SL13013

ROUTER CONTROL SOFTWARE

Sierra Video TyLinx Pro

Designed for the company's entire line of video and audio routing switchers; provides unique profiles for each user; adds additional security features for the control system; has a Windows-based GUI that allows users to virtually recreate their routing system on their computer desktops, defining sources and destinations, signal formats and cabling.

530-478-1000; www.sierravideo.com

Booth: SL6205

LCD VIDEO MONITOR

Wohler RM-4290W-2HD

Measures 4RU in height; incorporates two 9in widescreen LCDs with 800 x 480 resolution and 16.2 million colors.

510-870-0810; www.wohler.com

Booth: N1102

TRANSMITTERS

Emcee Titanium series

Medium-power UHF transmitters and translators; available in power output options of 250W to 2KW of average power; using high-efficiency amplifiers and a unique high-density air cooling system, series produces a large amount of power while consuming low amounts of electrical power.

480-315-1666; www.emceecom.com

Booth: C1415

NEWS PRODUCTION SYSTEM

vsn vsnnews

Allows text/video editing in the same application; covers all issues in a uniform environment, including rundown planning and creation, resource management, word processing, video feed recording, and archive storage, organization and cataloguing.

KinoFlo ParaBeam

HD Studio Light

ParaBeams make HD images look their best. Soft light quality is so important we designed TrueMatch® lamps calibrated to match the spectral response curves of HD. Parabolic reflectors intensify the light, while honeycomb louvers spot the light to 90°, 60° or 45°. Cool soft light keeps the talent happy, while advanced electronics deliver DMX dimming on a small energy footprint.

Please Light Responsibly.

SMART ANTENNA SYSTEM NSI NuPod

A low-profile, lightweight system that incorporates a directional antenna and continuous rotation positioner encapsulated within a nonconductive radome; specifically designed for mobile applications; features embedded control, which provides automatic alignment of the directional antenna and greatly simplifies operation; can be remotely controlled by the NSI MC5; ideal for transmit as well as receive applications.

410-964-8400; www.nsystems.com

Booth: C1715

TRANSMISSION SERVER SeaChange BMLxt

Adds features and performance capabilities to Broadcast MediaLibrary system; features SAS drivebased design that improves reliability; scales from a single 3.6TB node to a nine-node cluster providing almost 00TB, which can be combined with MediaClient software codecs for broadcast-quality HD and SD channels.

978-897-0100; www.schange.com

Booth: SU12009

HD WIRELESS CAMERA TRANSMITTER

Link Research L1500

Supports a wide selection of RF modules that can be swapped over to operate in bands of 1.4GHz to 7.5GHz; uses the company's encoding and modulation methods to cut transmission delays to about one frame, making the transmitter suitable for live sports productions; includes options for camera control for Sony and Thomson Grass Valley cameras.

PROCESSING ENGINE

da Vinci C.O.R.E.

The CUDA Optimized Resolve Engine provides R-series and 2K Plus systems with real-time throughput of nonlinear images in film, television, and other commercial applications; works to maximize the power and efficiency of scalable NVIDIA processing.

954-688-5600; www.davsys.com

Booth: SL3314

FINAL CUT PRO PLUG-IN AJA Video I/O HD

A transportable plug-in solution that works with HD and SD in Final Cut Studio 2; with a single FireWire 800 connection, it supports the new Apple ProRes 422 Codec natively, in hardware, to bring production-quality HD editing to the Mac Pro desktop and the MacBook Pro laptop.

530-274-2048; www.aja.com

Booth: SL2513

EDITING SOFTWARE

Avid Media Composer v3.5

Now includes native support of the Sony XDCAM format, allowing users to playback and edit directly from the disc, render, mixdown, export sequences and clips with eight audio tracks, and write back with sequence time code; supports stereoscopic workflows, enabling users to acquire, edit and display stereoscopic 3-D material; eliminates the need for a dongle key to activate new software purchases and upgrades; all new software sales and single seat upgrades will be licensed by a system activation key.

978-640-6789; www.avid.com

Booth: SU902

CAMERA RF AUDIO SYSTEM

Zaxcom QRX100

Receives four channels of audio from up to two stereo or mono digital transmitters; outputs these received audio channels as both analog and AES digital formats; a unique interface allows broadcasters to record all channels from four-channel ENG cameras quickly and easily.

973-835-5000

www.zaxcom.com

COAXIAL CABLE

Belden 7732LL

Plenum-rated RG-11 precision digital video coaxial cable; offers significant performance enhancements over Belden's previous plenum-rated version (Product No 7732A), especially when deployed in long cable runs for high-definition video (HD-SDI) or 1080p/60 applications; features a return loss of -23dB from 5MHz to 1.6MHz and -21dB from 1.6GHz to 4.5GHz.

800-245-3361; www.belden.com
Booth: C6508

FIXED SATELLITE SERVICES

Intelsat

The company's satellite fleets covering more than 99 percent of the world's population; operates more than 54 satellites with a fully integrated satellite operations model that features two operations centers connected by redundant fiber; a terrestrial network of teleports, points of presence and leased fiber links that Intelsat uses to carry traffic and provide satellite access for its customers complements its satellite fleet.

202-944-6800; www.intelsat.com
Booth: OE404, C4937

SATELLITE RECEIVER

Comtech Tiernan Video HMR5400

Fifth-generation receiver features both MPEG-2 and MPEG-4 capabilities; can decode HD (1080i and 720p) and SD (NTSC and PAL) formats; supports digital and analog video outputs; supports four pairs of audio in analog, digital and embedded formats; DVB-S L-band and ASI inputs are standard; DVB-S2, G.703 and IP are available as options; control is available through a complete front panel along with a Web interface and full SNMP support.

“COFDM SYSTEMS COULDN'T GET ANY SIMPLER”

That's what customers are saying about Broadcast Microwave Services' newest family of COFDM transmitters and receivers.

Take the CT2430LD-S transmitter: This compact unit develops 1W of output power with a power consumption of only 12W. And it can transmit in 16:9 format!

Or the DR2524LD-S receiver: This unit has two antenna inputs and uses our proven FFT-Maximum Ratio Combining (FFT-MRC) diversity technology to improve multi-path propagations. Even under the most difficult conditions, this product combination offers the highest possible link reliability.

CT2430LD-S Transmitter Specs

- Low System Delay (~40 ms typ.)
- COFDM 2k Transmission
- Transmit in 16:9 Format Option
- Camera Dockable with Brackets
- SDI Input
- Anton-Bauer/IDX/PAG Battery Mount
- Rugged and Lightweight Design
- Frequency Range: 2.0-2.5 GHz
- AES Encryption Option

DR2524LD-S Receiver Specs

- Low System Delay (~40 ms typ.)
- COFDM 2k Standard
- High Performance FFT-MRC Diversity
- RF Input with Integrated Downconverters
- SDI Output
- ASI Input and Output
- CVBS Output
- IP Streaming Option
- AES Decryption Option

AESDA, AESAD, and the AESQbox

Three new additions to the Whirlwind family

whirlwind

AESDA & AESAD

The **AESDA** and **AESAD** are rugged, portable units for professional quality D/A and A/D conversion in any setting, on location or in the studio.

Both units operate with battery power or the included AC adapter. 110 Ohm XLR and 75 Ohm BNC digital connections are provided and each unit has an analog TRS headphone output with a volume control. Extensive LED metering displays signal level and diagnostic information.

The **AESDA** converts the AES digital signal into dual XLR analog outputs with separate level controls. It also monitors the signal integrity of the digital input.

The **AESAD** features two balanced analog mic or line inputs with level controls and a word clock input for synchronization with other AES/EBU equipment. The mic inputs are transformer isolated and have 48V phantom power. Output sample rate is user selectable.

AESQbox

The **AESQbox** is an AES digital version of Whirlwind's famous analog Qbox.

Generate AES digital from analog Line In jack, built in dual tone generator or built in condenser microphone. Outputs at various sample rates.

Monitor from your AES digital system via built in speaker or Line Out / Headphone jack. Diagnostics identify sample rate, faults, and Pro / Consumer modes. Also operates as a quality A/D and D/A converter, impedance transformer, repeater and cable integrity checker.

Grass Valley's Kayenne

The new switchers support today's multifaceted productions.

BY DAVID CASPER

When the design team at Grass Valley set out to develop the next generation of production switchers, it understood that any new platform would have to meet the demands of today's more complex productions, supporting sophisticated, multilayered effects and HD signal processing.

Most importantly, the switcher control panel had to be laid so its new features were immediately familiar to technical directors, whether or not

to be the creative person answering to the director, but also the mechanic who knows how to get the most out of the switcher panel in front of them. The solution has to be easy to use and powerful, which is why Kayenne includes a highly intuitive user interface.

This ease of use starts with source rules, which allow an operator to set specific rules regarding how to handle different program elements. At a live football game, a broadcaster would never show a "live" bug over a replay. With Kayenne, the op-

All of the features, menu items and buttons are more easily accessible on the control surface. The menu navigation structure has been simplified to enable TDs to do more with less button pushes. With new tools like "History" and "Favorites"—which mimic Internet browsers—the TD can recall a desired menu with a single selection using the newly designed widescreen touch-screen control panel. Navigation is fast and easy, enabling the operator to assign and then return to a favorite menu item at will.

Grass Valley's Kayenne switchers offer broadcasters 1.5 to 4.5 M/E, with unique functionality, such as six keyers per M/E.

they were used to working on a Grass Valley switcher.

The result is the 1.5 to 4.5M/E Kayenne video production center, which offers a wide range of solutions to address operators' pressing concerns. The switchers feature unique operational functionality such as six keyers per M/E, 20 DPM channels, define E-MEM, aux bus transitions and source rules.

Switcher operators not only have

erator can now preprogram the keys that should be added or dropped to match specific sources. These source rules can also be used on preview before being taken to air. Previously, the operator had to remember these implicit or explicit rules according to a director's wishes and then apply them. Source rules make this laborious task easy and protects against errors, providing a safety net for operators.

A vibrant yet elegant control panel

The new control surface is perhaps the switcher's most visible attribute. Several ergonomic studies and prototype models were used to develop a control panel that makes switching sources and effects easy, even after long hours of operation. Its modular design affects how the switcher can be used as well as how it can be serviced. All of the modules are hot-swappable, so if one component fails, it will not affect the entire panel and can easily be replaced during production.

The panel can be curved or flat, depending on the installer's preference, making all of the buttons easy to see and reach. Two rows of configurable OLED source and function name displays provide crisp legibility at a wide range of viewing angles. All panel buttons are RGB. Color is used to aid the technical director by indicating M/E stripe and key row delegation, as well as functional delegation, and can be used to highlight sources.

Soft buttons feature a four-character LED display above them. The LED titles tell the operator which function is assigned, and the button color indicates the overall mode of operation.

AVOCENT gets you to true Digital!

Avocent HMX Extender Provides High Resolution DVI Extension and Matrix Switching over LAN

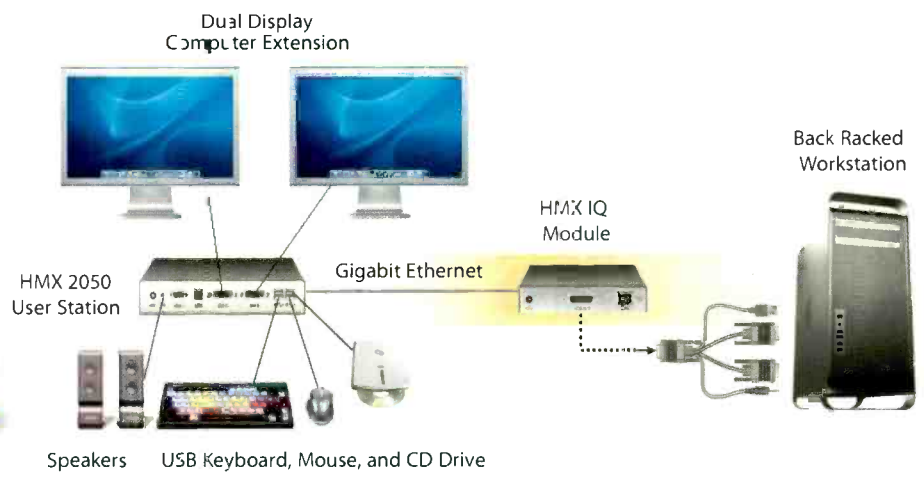

Avocent's HMX extender platform, built on TCP/IP standards, enables extension of DVI over a Gig-E network infrastructure with a single LAN connection. Avocent has engineered the "digital missing link" between digital graphics cards and digital displays, with HMX Digital Extension technology. The HMX extender solution eliminates distance limitations of traditional analog KVM systems and also extends USB and audio on the same single CAT6 cable.

- Supports up to dual 1920 x 1200 DVI resolution
- USB devices and storage media
- CD quality audio
- Single head or dual head models
- Support full matrix switching with HMX Manager

BOOTH NO. SL13616

By incorporating all three elements — OLEDs, RGB buttons and soft buttons — the system is simple to operate.

The features TDs need most

For many years the goal has been to add more features into the TD's toolbox. Kayenne offers 20 channels of DVE available at the touch of a button, as well as six keyers per M/E to support multilayer effects. It also includes one minute of HD storage for stills and clips, which is especially useful for animated transitions. This is all accomplished by leveraging leading-edge FPGA technology.

In addition, the switcher features several new control functions. It has a panel module dedicated to external device control, complete with a jog shuttle wheel, and access to a library of cues. These cues identify clips by device, name, duration (time code), etc. Cues can be recalled from an E-MEM

Kayenne features a widescreen touch-screen control panel, which allows operators fast and easy navigation.

directly or by being manually loaded from the device control module and then played in conjunction with an E-MEM.

The entire E-MEM system has also been improved for better performance. There's a finer granularity and more

precise control, where the operator has access to 23 sublevels within each M/E. Prior to this new development, an E-MEM took a snapshot of the whole M/E. Now the TD can keyframe one iDPM channel or a single key without affecting the rest of the M/E. This

Zeus
BROADCAST

flexibility allows a TD to build more interesting effects in less time.

Likewise, the architecture has been structured to accommodate the tight quarters of a production truck or space-limited control rooms. The switcher's control panel runs silently during operation because the cooling fans and CPU have been moved into an external panel control unit that can be located up to 50ft away.

Internal format conversion

The Kayenne includes in and out conversion features to handle any type of mixed format production. If an operator has an HD project and has to produce an SD output, he doesn't have to burn up an M/E to do so. This is accomplished via circuitry internal to the switcher. The switcher can handle both 16:9 and 4:3 aspect ratios within a single production by automatically inserting video

into sidebars on 4:3 sources for 16:9 viewing.

Mixed format production is handled with a feature called MatchDef, which facilitates internal input conversion (from SD to HD, or vice versa, or cross-conversion) so that the TD is always working in the same format inside the switcher. Another feature, SetDef, is used for setting the resolution of the required output. These internal converters use motion adaptor circuitry, color space conversion and other high-quality signal processing techniques.

FlexiKey allows an operator to create programmable clean feeds. Each M/E channel has four program outputs, and the user can specify which keys go on which outputs. This allows Kayenne to support multiple program feeds with different titles over the same background for multichannel applications.

The switcher is available in a range

of video processing frames from 1.5 to 4.5 M/E (with the half M/E standard in all frames).

A switcher ready for today

Kayenne is being introduced at NAB 2009 with all frame and panel models immediately available. For the purist TD, many features of Grass Valley's switchers have been reintroduced. For example, the split-level arm that was used in earlier switchers is back on the Kayenne, this time for use by DoubleTake, the split M/E mode introduced with Kalypso. Now the primary and secondary M/E partitions provided by DoubleTake can be independently controlled at the same time to create captivating effects on-screen.

Building file-based workflows

Understand the true essence of workflow.

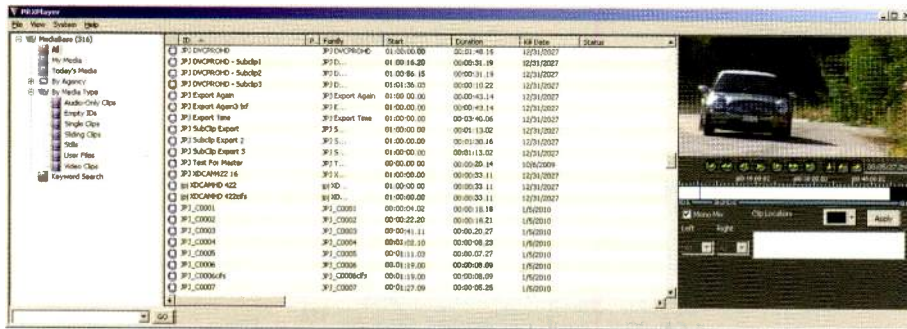

BY JOHN LUFF

You don't have to look too far into broadcast technology today to see a fundamental shift in paradigm at work. For decades, since the first audio recorders were used in radio broadcasts, we have been focused on the conception that physical media contains programs for broadcast. Millions of hours of "content" exist on shelves in stations and in deep archives in all parts of the world. We

ters, to which I would tell you, "elementary, my dear Watson." A file-based workflow is all about moving and processing versions of content for air, not about processing the original works. There are some key concepts that need to be understood. In this article, instances refer to precise copies of a piece of content that cannot be distinguished from the original. Different instances are clones of the original, which cannot be differentiated from the original.

But this raises questions about managing multiple instances that are not always transparent. How do you distinguish between the copy in the archive, the backup data tape on a shelf and the copy in the air server? You have to be able to know where copies live if you are to manage them effectively, and you must be able to recognize them as copies and not original works.

The other concept, parent and child, is quite different. The parent, perhaps the original of a program, can be used to make a copy, a child if you will, with perhaps different bit rates or audio tracks for release for other purposes. Indeed, a derivative of a PBS program might have different underwriting credits, or a child of a syndicated program might be edited to allow an extra commercial break. It is the same program in the most generic sense, but differs in critical ways, making it essentially a new program derived from the parent. Another example is a down-converted copy of an HD program displayed in a letterbox on a 4:3 screen. It contains the same content, but in a different form, and is easily identified as a derivative of the original.

Harris' NEXIO Browse helps eliminate the need for a complex baseband infrastructure for proxy storage and management, making it easier to deploy a low-resolution, file-based workflow in news and sports operations.

think of the media as the actual program, which is a convenient construct, though at best imprecise.

The original work in our business is by definition ethereal, unlike, for instance, works of art that hang in museums. What we really have is no more than a representation of the original work sampled by either analog or digital means and stored on media that we can use to reproduce a simulation of the content at a convenient time. The same is true of books, where the author's original copy is used to create many copies for consumption by an arbitrary universe of users. Each book appears to be the original work, but of course we know that is not true.

You probably wonder why this mat-

Parent and child in this context refer to original content and derivative works made from it. Let me further explain the meaning and implications.

Two concepts for understanding workflows

You might have two instances of precisely the same piece of content in redundant servers, with redundant storage used for protection of air signals. No matter which copy plays, you cannot determine a difference because the copies are in fact two instances of the same thing. Think of it as multiple copies of a book at your local bookstore. It doesn't matter which one you read, because each was produced in precisely the same "workflow."

Defining a workflow

File-based workflow is all about facilitating the processes that are possible while maintaining control over the content through managing metadata and tracking instances and relationships between media in external databases. Doing so allows orderly media management that enhances the value of the original asset and avoids destroying the original work to create a derivative.

To be clear, there is nothing new about these concepts. Tape-based

workflow 40 years ago when I worked on "The Johnny Cash Show" was only different in the sense that the media was sampled using analog means, and the tracking was done with file cards containing notes we call metadata today. We created instances to be used for protection masters and audio sweetening that — while not true clones — were as close as technology would permit. We could trace back to the original recordings if something happened to the edit master because there were technical differences, but the workflow shared many of the same attributes. We delivered copies to ABC in New York that were dubs with commercials physically cut into the dub. They were clearly children of the edit master. In fact, we had two protection masters on the shelf, made at the same time, in the event the plane went down carrying tapes to New York. Those were truly second instances and not derivatives.

File-based workflow today allows us to create, often using automated processes, the derivatives and additional instances we need for production and air of content. When a motion picture airs today, it is a derivative transferred from the original work (film), and then protected and distributed as additional instances after editing a new child from the parent media as delivered from the studio.

Let me try to be precise about why this matters. Though technology allows new processes and different workflow that files facilitate, the most essential step is to define a workflow based not on the fact that it is file-based but rather on the manipulation and copying of the original essence of the media. If you can define a process and the intended result, you can build a workflow that uses file-based content to great advantage.

It is not, however, an improvement in workflow to replicate workflow from old paradigms in a newer technological era. The temptation to do so is great, but resist that temptation at all costs. Nothing is gained if you take that easy route. Rather, it is appropriate to throw out all assumptions about what "has to be done" and instead look at what needs to be delivered. Commercials can be delivered as files to edge servers in a station and then played out as analog video to be recorded in a video server for integration into the concatenated air signal. That treats the instance of the content in the edge server as original essence with another instance created by conventional means.

It is substantially better to clone the content directly to the air server via FTP transfer, with perhaps new wrappers and specs. While that might be a new derivative, it allows for the best of digital file-based workflow to enhance quality and improve tracking of the metadata resident in the edge server that is not transferred with an analog dub. Keeping these concepts in mind should help you to understand the true essence of workflow in modern file-based systems. **BE**

Broadcasters in postland

The 2009 HPA Technology Retreat gave industry leaders an open forum for sharing new technologies.

BY ANTHONY R. GARGANO

A trip out of the cold and snow of the Northeast to the palm trees and warmth of sunny Rancho Mirage, CA — must be a boondoggle. Actually, it really wasn't. The Westin Mission Hills at Rancho Mirage was the host venue for the recent Hollywood Post Alliance (HPA) Technology Retreat. This event is noteworthy for the quality of its presentations and the high-level discussions of the latest in technologies impacting our industry today and influencing its direction for the future.

In addition, attendees from cable networks ESPN, HBO and TBS were there along with representatives from the ATSC, the EBU, the NAB and SMPTE.

By way of background, the ITS was founded in 1986 with roots in Hollywood as a trade association to support and advance the common agendas of the production and post-production community. It grew quickly and soon had local chapters in the content creation hotbeds of Chicago, Hollywood, London, Miami and New York among others. Last known as the Association of Imaging Technology and Sound, a combination of factors caused it to seemingly lose its way, and the trade group folded in 2001. Notwithstanding the ITS' demise, the Hollywood community still found a continuing need for a common forum to share ideas and to serve as an advocate for the content community. Thus, out of the ashes of the local Hollywood ITS chapter was born the Hollywood Post Alliance.

digital age TV test patterns to high frame rate television, from 4K imaging techniques to 3-D, including 3-D acquisition, 3-D compatibility and 3-D display. If attendees weren't overloaded with technology by the end of the day, in the evenings they could attend technology demonstrations by some 60 companies in a separate ballroom. But don't get the wrong idea; this is not a trade show, and you won't find supplier booths. Manufacturers were confined to simple 10ft tables with actual demonstrations of technology — not just selling products. This is in keeping with the high standards that the HPA maintains to keep the event first and foremost as a technology symposium.

Attendees also had the opportunity to participate in early morning breakfast roundtables that took place before the day's formal sessions. There were about 30 tables, each with a different technology topic and hosted by a discussion leader. In a uniquely informal environment, after picking up bacon and eggs from the breakfast buffet, attendees could select a table to join and either participate in or just listen to the topic of their choice being discussed by a cross section of retreat attendees.

If you are interested in a truly learning, sharing experience, this is the event to attend. The HPA limits attendance to the Technology Retreat, so book early. Next year's event is scheduled for Feb. 17-19 at the Rancho Las Palmas Resort in Rancho Mirage. Pencil it in on your calendar. It should be well worth the trip. **BE**

Anthony R. Gargano is a consultant and former industry executive.

The HPA Technology Retreat is known for the quality of its presentations and discussions, such as the one shown here from Ioan Allen (at the podium) of Dolby Labs.

The birth of HPA

The annual event was the ninth under the auspices of the HPA and the fifteenth since the Technology Retreat's inception from its roots in the now defunct International Teleproduction Society (ITS). But, don't let the name mislead you. The 400 attendees represented a significant cross section of our industry. Numbered among them were not only representatives from the Hollywood post and production community but also technology executives from the CBS, FOX, NBC and PBS broadcast

Technology retreat

One of the more popular undertakings initiated by the ITS was the establishment of an annual technology sharing event, and to its credit, the HPA has carried on this activity. The annual retreat is organized by HPA executive director Eileen Kramer.

The quality of the presentations and discussions at the event are at a level that not only draws attendance from the United States but also now attracts a growing international participation, with attendees this year traveling from Canada, Europe, Japan and the UK. Presentations were quite varied and covered everything from

IntelliGain™ Loudness & Dynamic Range Processor Inter-Program and Intra-Program Loudness Control

Broadcasters are always challenged to provide audio content to their target audience while minimizing complaints about variations in loudness between programs and commercials, and from channel to channel.

Evertz® provides the solution with the award-winning IntelliGain™ 'Sound Advice' product suite.

Program Audio without IntelliGain™ Applied:

Program Audio with IntelliGain™ Applied:

IntelliGain™ Features:

- Consistent audio loudness levels within a channel and/or program
- Automatic detection and level adjust for loud commercials
- Gain control within a program interval to preserve audio dynamic range
- Artifact-free transitions between program and commercials
- Elimination of drastic volume changes during commercials & interstitials
- Ideal for aggregator applications and multi-channel playout facilities
- VistaLINK® controlled and monitored

IntelliGain™ can be applied to a number of Evertz® products including:

- Frame Synchronizers
- Protection Switches
- Audio Embedders
- Audio De-Embedders
- Dolby Encoders
- Dolby Decoders
- Routers
- Intelligent Distribution Amplifiers
- MPEG Decoders
- Up/Down/Cross Converters

**Over 1000 Channels Served with IntelliGain™
...and Counting!**
