STEP UP PRODUCTION

In the Laboratory—On the Assembly Line
with

C.T.C. *All-Set* TERMINAL BOARDS

No more time-wasting board cutting, drilling and lug mounting when you have C.T.C. All-Set Terminal Boards on hand. They're furnished completely assembled with any size C.T.C. Turret Terminal Lug in four widths, $\frac{1}{2}$ " ; 2" (lug row spacing $1\frac{1}{2}$ "); $2\frac{1}{2}$ " (lug row spacing 2"); 3" (lug row spacing $2\frac{1}{2}$ ") to fit all standard resistors and condensers. Select proper width board and go to work.

C.T.C. All-Set Terminal Boards are made of $\frac{3}{32}$ " , $\frac{1}{8}$ " and $\frac{3}{16}$ " linen bakelite only and come in five-section boards which can be broken into fifths by bending on a scribed line. They may be ordered in sets of the four widths, or in lots of six or multiples of six in any single width. Extra lugs and stand-offs are supplied.

For complete information on these new, money-saving All-Set Terminal Boards, write for C.T.C. Catalog Number 100.

CAMBRIDGE THERMIONIC CORPORATION
442 CONCORD AVENUE • CAMBRIDGE 38, MASSACHUSETTS

Yes...the "Lab" work is *Complete!*

OUR post-war plans, policies and perfected line of Eastern sound equipment have long ago passed the stage of draft-board design and laboratory tests! We're "in the groove"—ready to go! Based on our many years of experience, the new Eastern equipment incorporates the many

wartime techniques which we have been building into *quality* units for Uncle Sam.

For details and information please fill out and mail the Coupon today. Eastern Amplifier Corporation, 794 East 140th Street, New York 54, New York.

EASTERN AMPLIFIERS

This is Your Ticket

for complete information on our post-war line and the details of our proposition.

EASTERN AMPLIFIER CORPORATION, Dept. 8-G
794 East 140th St., New York 54, N. Y.

We are JOBBERS, DEALERS, A SERVICE ORGANIZATION, SOUND SPECIALISTS. We're definitely interested in your post-war line, your policy, your proposition. Mail us complete information, without obligation.

We See...

THE POSTWAR ERA HAS COME AT LAST. Many thanks are due to the men and women in the communications industry for their excellent work during the war. Their efforts played an important role in bringing World War II to a close.

With the backlog of a host of unusual military developments and our ambitious postwar projects, radio communications is destined to play a major role in peacetime world planning.

The rapidity of the release of important wartime developments for peacetime programs will of course be quite a governing factor in development and production. Analyzing this problem, FCC Commissioner E. K. Jett said, in an exclusive statement to COMMUNICATIONS:

"On entering the peacetime era our thoughts and efforts must be directed primarily to the needs of the American public. The public has been led to believe that many improvements will be made in communications, including the licensing of new services such as television, f-m, facsimile, urban and highway mobile, citizens radio and many others. However, many of the wartime developments are still classified as secret or confidential, and there has been no opportunity for industry as a whole to consider them with a view to adopting uniform standards. Since it is of the utmost importance that the design of equipment be as nearly perfect as the present state of development of the art will permit, I hope that a way will be found to declassify and release such technical information as promptly as may be possible."

When these accumulated developments are released and peacetime projects are accordingly accelerated, we will see quite a striking array of equipment and components.

Broadcasting activities should rise to new heights during the months to come. Records indicate that over 100 television stations, 500 f-m stations and close to 200 new a-m stations are scheduled for construction very soon. Relay networks will also play an important role. Commenting on this fact, Dr. C. B. Joliffe, of RCA, says that it is not fantastic to imagine long telephone and telegraph lines being replaced by relay towers from coast to coast.

The release of radar has also highlighted communications contribution during the past few years. Its application to air and sea piloting will revolutionize the art of navigation. The U. S. Merchant Marine has already indicated that it will install radar control on their ships. And the CAA have also certified the use of radar. Out at the CAA experimental station at Indianapolis, ten carloads of radar were recently delivered. The equipment will be used to increase safety factors particularly in zones of traffic saturation.

Communications has quite a job on hand. But, as during the war, we know that the job will be well done. . . . L. W.

HIGH FREQUENCY INDUCTION FURNACE USED IN TUBE PLANT

The bombarder or high frequency induction furnace pictured below is another example of high-precision, modern equipment manufactured at Sylvania Electric's plant in Williamsport, Pa.

Flexible in Application

Used in all radio tube plants where exhaust machines operate, this essential apparatus may also be adapted for use in practically any application that requires high frequency induction heating by the connection of the proper heating coils. Its rated input is 25KVA, uses Type 207 tube as oscillator, frequency about 300KC.

High frequency induction furnace used in all radio tube plants where exhaust machines operate. Made by Sylvania Electric at Williamsport, Pa.

LOCK-IN TUBES PERFECTLY IN LINE WITH RECENT FCC DECISION

*High Frequency Sets (FM) Will
Get Benefit of Tubes' Electrical Superiority*

THE "LOCK-IN" TUBE

- 1 It is "locked" to socket —solidly.
- 2 It has short, direct connections—lower inductance leads and fewer welded joints.
- 3 Metal "Lock-In" locating lug — also acts as shield between pins.
- 4 No top cap connection... overhead wires eliminated.

Sylvania Electric's revolutionary type of radio tube — the Lock-In — is so mechanically stronger and electrically more efficient that it takes in its stride the recent FCC decision assigning to frequency modulation the band between 88 and 106 megacycles. The basic electrical advantages of the Lock-In construction are ideally suited to the adoption of higher frequencies.

Mechanically it is more rugged because support rods are stronger and thicker—there are fewer welded joints and no soldered joints—the lock-in lug is metal not molded plastic—the ele-

ments are prevented from warping and weaving.

Electrically, it is more efficient because the element leads are brought directly down through the low loss glass header to become sturdy socket pins—reducing lead inductance—and interelement capacity.

Today, the many special features of the Sylvania Lock-In Tube are even more up-to-date than when they were introduced in 1938—a fact of increasing importance when considering the numerous postwar developments in the field of communications.

DUMONT—FOR THE TOOLS OF TELEVISION

PROOF OF THE PUDDING!

DuMont has designed and built *more* television stations than any other company. DuMont-built stations, every week, are demonstrating the high efficiency, rugged dependability and low operating cost of DuMont-engineered equipment.

DuMont's simplified precision control—the dominant keynote of *all* DuMont design—is brilliantly exemplified in the tools of television featured above. These postwar

designs incorporate all the flexibility and refinements dictated by more than 4 years of continuous and increasingly elaborate experimentation by hundreds of program producers.

DuMont's Station WABD, New York, has pioneered a pattern for commercial television that you can make your own whenever you choose to study it. And DuMont's Equipment Reservation Plan insures early peacetime delivery of your equipment and competent training of your personnel. *Television is our business!*

**Call on
Kyle Engineers**

**For transformers
designed to your own
specifications**

Postwar plans are under way. The sensational development in the use of electronic power will soon be converted to building products for home and industrial use, for transportation, communications, agriculture—for almost every service of modern living.

Kyle experience in building transformers for war can serve you well. Kyle's many years in developing and manufacturing electric power distribution equipment established their reputation for sound, practical engineering.

Based on their knowledge of the latest trends in the fields of radio communication, radar detection, and electronic controls, Kyle engineers will build the transformers you need to meet your exact specifications. These precisely built, dependable, small transformers are hermetically sealed to function perfectly under extreme conditions of climate and altitude.

Call on Kyle engineers to work with you on your own transformer requirements.

Answers to your Questions about the SHURE "556" Super-Cardioid Broadcast Dynamic

Q. *What is meant by Super-Cardioid?*

Answer: Super-Cardioid is an improvement on the cardioid (heart-shaped) pickup pattern, which makes it even more unidirectional. "Super-Cardioid" reduces pickup of random noises by 73% as compared to 67% for the Cardioid, and yet has a wide pickup angle across the front.

Q. *To accomplish this, is it necessary to have two Microphones in a single case?*

Answer: No. The Shure "556" is designed according to the "Uniphase" principle, a patented Shure development which makes it possible to obtain the "Super-Cardioid" pattern in a single compact, rugged unit.

Q. *Over what range does the Shure "556" give quality reproduction?*

Answer: The Shure "556" provides a high degree of directivity, both horizontally and vertically over a wide frequency range from 40 to 10,000 cycles.

Q. *Does the Shure "556" reduce feedback?*

Answer: Yes! Reflected sounds and "spill-over" from loud speakers entering from the rear are cancelled out within the Microphone.

Q. *Can the Shure "556" be used outdoors?*

Answer: Yes. It is insensitive to wind and will withstand heat and humidity. The low impedance models may be used at practically unlimited distances from the amplifier.

Q. *Can the Shure "556" be used for Studio Broadcasting?*

Answer: More than 750 Radio Broadcast Stations in the United States and Canada use the Shure "556" in their studios. Because it can be placed with its back to the wall without picking up reflected sounds or echoes, it facilitates Microphone placement.

*Model 556A for 35-50 Ohm circuits—
LIST PRICE \$75*

*Model 556B for 200-600 Ohm circuits—
LIST PRICE \$75*

A WISE TREND

A few years ago plugs and jacks were uncommon except for a few applications in radio and test equipment. Today the trend to greater use of plugs and jacks is fast becoming standard practice in radio and electronic industries.

Keeping up with this trend, Johnson has designed many new plugs to meet industries special requirements, as well as supplying standard plugs which are being used in an increasing number of new applications.

The use of plugs on components is growing more popular, speeding production, facilitating easy replacement and interchanging of parts.

Plug and jack assemblies make it possible to remove sections of equipment for repair and maintenance without disturbing the wiring, and in police, fire, railroad and similar installation, units which fail may be quickly replaced with little delay in operation.

Let Johnson, a pioneer in the manufacture of plugs and jacks, supply you with a plug and jack combination or assembly to meet your requirements.

Send us your problem.

POSITIVE **SNAP** ACTION

0.02 WATT SENSITIVITY

SIMPLIFIED CONSTRUCTION ... Features include snap action contacts; high sensitivity; low operating power; statically balanced armature and contact assembly; six easily accessible adjustments; good contact wipe and stable contact pressure.

79XAX

Struthers-Dunn Type 79XAX snap action d-c operated relay is a positive acting sensitive unit that finds a wide variety of applications in circuits with slowly changing control currents. Erratic operation and varying contact resistance encountered with ordinary sensitive relays are eliminated. Applications for this popular relay cover a broad range of use from vacuum tube circuits, to overcurrent protection, pulsing circuits, and uses where extremely close differential or sensitivity of operation is required.

WRITE for Data Bulletin 79XAX giving full construction details and outlining a variety of suggested uses.

Federal . . . **KNOWS H-F Cable**

Inside and Out

From inner conductor to outer covering . . . Federal really knows high-frequency transmission lines.

And this knowledge was not easily won. As the pioneer in the field Federal not only developed over 80% of all h-f cable types in use today . . . but developed most of the equipment needed to test them.

Attenuation, high-voltage, dielectric and balance testing equipment, velocity of propagation, braid-resistance and electri-

cal length meters . . . were all Federal-engineered to fit specific requirements.

That's why it's logical to turn to the acknowledged leader in the field for the finest in h-f cables, specialty-engineered harnesses and cable assemblies.

Where requirements are critical . . . for transmission lines with special characteristics . . . for custom-built and engineered harnesses and cable assemblies . . . take your high-frequency transmission problems to Federal.

Federal Telephone and Radio Corporation

Newark 1, N. J.

A. H. Brolly . . . Chief Engineer of Television Station WBKB, Chicago, adjusts the grid circuit of the Eimac 304-TL's in the Class B linear stage of the video transmitter.

Mr. Brolly calls attention to the Eimac 1000-T's in the final stage of the Audio FM Transmitter which operates at 65.75 megacycles. It is a very stable amplifier of good efficiency.

**IT'S EIMAC AGAIN!
FIRST CHOICE FOR
THE KEY SOCKETS
AT TELEVISION
STATION WBKB**

The video transmitter operates at 61.25 megacycles; peak power output is 4 KW which provides a television service throughout metropolitan Chicago and reaches suburbs out to 35 miles or more.

Eimac 152-T's are used in the modulated stage and 304-T's in the first Class B linear amplifier of the video transmitter.

E. F. Cawthon and W. R. Brock are operating the station which has been broadcasting television programs with the present equipment since 1942 and began operation on a commercial schedule in October, 1943.

Grid modulation is employed at WBKB and a broad band of frequencies must be passed in all stages following the modulated amplifier. Multiple-tuned resistance loaded coupling circuits are used between stages.

Performance, stability, dependability are good reasons why Eimac tubes are to be found in the key sockets of the outstanding new developments in Electronics. Balaban & Katz, owners of television station WBKB of Chicago, offer potent confirmation of the fact that Eimac tubes are first choice of leading Electronic Engineers the world over.

AMPHENOL ENGINEERS

**have created thousands of
electronic products**

The versatility of Amphenol engineers is evidenced in the varied electronic applications for which they have designed and produced components. Many of the now standard sockets, connectors and cables produced by Amphenol were originally created to surpass the most exacting specifications.

Products illustrated here are but a few of the thousands of items that comprise the complete Amphenol line including U.H.F. Cables and Connectors, Conduit, Fittings, Connectors (A-N., U.H.F., British), Cable Assemblies, Radio Parts and Plastics for Industry.

Your inquiry regarding the adaptation of standard Amphenol components or designing of special purpose units will receive prompt, careful and confidential consideration.

*Capacitors***

SPECIFY AEROVOX

Be sure you have the Aerovox Capacitor Manual in your working library, for general guidance. And for final insurance covering satisfactory results, just specify Aerovox Capacitors.

● Aerovox selection ranges from tiny "postage-stamp" molded-in-bakelite units to giant porcelain-cased stack-mounting units. These many varied types are standard with Aerovox—in daily production—available at quantity-production prices.

The following factors are suggested in guiding your selection:

Electrical: (a) Capacitance and tolerance; (b) D.C. voltage rating; (c) Current-carrying capacity and frequency characteristics; (d) Allowable temperature rise and maximum operating temperature; (e) Special characteristics such as temperature coefficient, retrace, etc.; (f) Special operating condi-

tions such as high humidity, altitude, extreme temperatures, etc. **Mechanical:** (g) Basic type; (h) Terminals; (i) Case; (j) Mounting holes; (k) Name-plate data.

Yes, Aerovox expects you to select that type best fitting your particular requirements in every way. And Aerovox is ready to help you make the proper selection. Remember, Aerovox Application Engineering—that "know-how" second to none in the industry—can make all the difference between disastrous makeshifts and the most satisfactory results.

Radio Out of a Hat!

A new interpretation of simplified VHF, scheduled for early announcement, is the latest development of the company's radio engineering laboratory.

Quality In quantity is the keynote of all Pacific Division manufacturing processes.

Pacific Division's engineering ability is matched by its outstanding production facilities. Here future VHF equipment will be manufactured in volume.

88 DAYS FROM DRAFTING BOARD TO FLIGHT LINE

Germany stunned the world in '39 with their *blitzkrieg*. At exactly the same time another *blitzkrieg* was quietly being made by the Canadians in this country. They needed airplanes and radio communication equipment—fast.

The airplanes they got...and the radios. There were less than 90 days left when Pacific Division got the go ahead for transmitters and interphone equipment that had not even been designed.

In 88 days Pacific Division designed—developed—and delivered a quantity of 100-watt master oscillator transmitters for low and high frequency...amplifiers for the interphone...and engineered and installed these and all other radio equipment in the Canadian airplanes.

We at Pacific Division would rather not accept any more orders that we have to pull out of a hat. But we are open for business, especially VHF Communication Systems in which we specialize, that demands experience, ability and resourcefulness. Your inquiries are invited.

Centralab

Medium Duty Power Switches

- 7½ amp. 115 V. 60 cycle A. C.
- Voltage breakdown 2500 V to ground D. C.
- Solid silver contacts
- 25,000 cycles of operation without contact failure
- Fixed stops to limit rotation
- 20° indexing

Centralab medium duty power switches are now available for transmitters (has been used up to 20 megacycles) power supply converters and for certain industrial and electronic uses.

It is indicated in applications where the average Selector Switch is not of sufficient accuracy or power rating. Its accuracy of contact is gained by a square shaft, sleeve fit rotor, and individually aligned and adjusted contacts. It is assembled in multiple gangs with shorting or non-shorting contacts. Torque can be adjusted to suit individual requirements. Furnished in 1 pole . . . 2 to 17 positions (with 18th position continuous rotation with 18th position as "off"); and 2 or 3 pole . . . 2 to 6 position including "off".

TWO NEW GASEOUS VOLTAGE REGULATORS

In Miniature

The list of Hytron's customers for the standard OC3/VR105 and OD3/VR150 reads like the social register of electronics. Proved quality products, these Hytron tubes are found literally by the millions in military radar, communications, and electronic equipment.

Now in space-saving miniature bulbs, the new Hytron OA2 and OB2 offer the same careful engineering design, rigid control of processing and assembly, and adherence to tight factory specifications which have made the standard Hytron regulators famous. Life and performance of the miniature OA2 and OB2 equal those of the standard tubes, except that maximum operating current is 30 ma. for the miniatures. Construction is both simple and rugged. Note, for example, use of both top and bottom mica supports and the heavy stem leads. Compare the characteristic data given. Consider the possible space economies. Order your engineering samples today.

COMPARATIVE DATA

HYTRON MINIATURE AND STANDARD GASEOUS VOLTAGE REGULATOR TUBES

TYPE	PHYSICAL CHARACTERISTICS				AVERAGE OPERATING CONDITIONS			
	Max. Length (inches)	Max. Diam. (inches)	Bulb	Base	Supply Voltage † (min.)	Operating Voltage (approx.)	Regulation $E_{30} - E_5$ ‡ (volts)	Operating Current* (ma.)
OA2	2 $\frac{5}{8}$	$\frac{3}{4}$	T-5 $\frac{1}{2}$	7-pin Min.	185	150	2	5-30
OD3/VR150	4 $\frac{1}{8}$	1 $\frac{1}{8}$	ST-12	6-pin Octal				5-40
OB2	2 $\frac{5}{8}$	$\frac{3}{4}$	T-5 $\frac{1}{2}$	7-pin Min.	133	108	1	5-30
OC3/VR105	4 $\frac{1}{8}$	1 $\frac{1}{8}$	ST-12	6-pin Octal				5-40

†Sufficient resistance must always be used in series with the tube to limit current through it as follows: OA2 and OB2, 30 ma.; OD3/VR150 and OC3/VR105, 40 ma.

‡Regulation (either positive or negative polarity) is defined as the difference in voltage when the current is varied from 5 ma. to 30 ma.

*Operation for extended periods of time at low current will temporarily increase regulation of tube.

HOW WE SAVE 45 MINUTES OUT OF AN HOUR

When Connecticut Telephone & Electric Division began to make aircraft ignition terminals for a famous engine manufacturer, we knew that standard testing procedure could not keep pace with our mass production methods. Even a score of trained inspectors, each equipped with high-voltage testing equipment, would soon fall hopelessly behind.

Again Great American Industries engineers overcame a stubborn wartime bottleneck. They designed an electro-

mechanical tester which accurately checks four parts faster than former methods could check one. Five such testers, operated by unskilled persons, have a capacity of 12,500 tests an hour . . . with a degree of error almost too small to measure.

This is but one of many new methods, contributed by G.A.I. engineering to speed the war effort. It will be equally important to efficient electrical manufacturing in time of peace.

HERE'S HOW IT'S DONE

Operator places terminals to be tested in slots at edge of turntable. As each part reaches test point, one electrode of a 10,500 v. circuit contacts the conductor element of the terminal . . . while another encircles its insulating shell. Current leakage through minute cracks or porous sections of the insulation operates a relay which ejects the faulty piece. If the terminal meets specifications, it automatically falls into a chute and is conveyed to the packing bench. This swift, foolproof tester lends itself to many production tests of insulation.

THESE ARE
MACHLETT
TECHNIQUES

The above ten Machlett techniques reflect only a part of one side of this organization — that of technical capability.

It takes much more than even the highest techniques to make a business great. There is also required a thorough knowledge of customers' requirements, and that conscientious, painstaking, continuing meeting of them called "service."

Just as there is the most intimate relationship between an electron tube and the equipment with which it is connected, so there is a close and constant contact with our customers.

With them we are never in competition, and thus we may be, and often are, called upon to do design and development work, to live with tube and equipment problems, and cooperate in solving them. We often follow through all the way to the ultimate users, to make certain of their satisfaction and see that conditions of use are such as to assure optimum results and economy. It is a long-established Machlett practice not merely to accept but to seek out every opportunity to serve. Thus, Machlett customers obtain much more than the best possible tubes. When you need a medical or indus-

trial X-ray tube, or a radio or industrial oscillator, amplifier or rectifier, it will pay you to choose a Machlett. Write for information as to available types, identifying the associated equipment and nature of use. Machlett Laboratories, Inc., Springdale, Connecticut.

APPLIES TO RADIO AND INDUSTRIAL USES
ITS 48 YEARS OF ELECTRON-TUBE EXPERIENCE

It May Look the Same... But...

New Rola speakers may look similar to prewar models. But in performance, fidelity and craftsmanship there will be no comparison! Rola research, intensified by war needs, has paced the swiftly advancing stride of electronic development.

Improvements, exclusive with Rola, will be incorporated in the broadened line of speakers. And the developments and processes that have resulted from exacting wartime tasks will

further guarantee the quality and dependability which, for a quarter of a century, have made Rola a leader.

Rola's greatly expanded production facilities still are absorbed in supplying communication needs of our military forces—but it is possible, now, to provide experimental models and demonstrate to interested manufacturers Rola's improved engineering and performance.

ROLA SPEAKERS NOW AVAILABLE FOR RATED ORDERS

A few weeks ago Rola resumed the manufacture of Speakers in moderate quantities and for rated orders. Inquiries are invited from manufacturers who need quality speakers for priority contracts.

ROLA

DESIGN

by remote control

The design of radio equipment that will come from Hallicrafters is already shaping up—determined largely by thousands of hams who, from their remote control locations all over the world, are sending advice and suggestions on new radio ideas to Hallicrafters engineering department.

Thousands and thousands of Hallicrafters pieces of high frequency radio equipment are in use in the armed services. In a high percentage of cases this equipment is used by operators with practical amateur experience. From these qualified experts Hallicrafters has received hundreds of letters telling how Hallicrafters-built equipment stands up under the most vicious battle conditions. Hallicrafters receives regularly many valuable suggestions from hams in the field and at home. From this rich deposit of "design by remote control" will emerge Hallicrafters new line—built to meet ham requirements, designed for the world's most exacting users—the radio amateurs.

How many spots in communications equipment can you find for this newest MICARTA product?

Here's a new boost, and a challenge, to communications and electronic designers . . . coil forms from Micarta "444", the latest Westinghouse development in industrial plastics.

These strong, lightweight forms provide greater freedom in production due to the insulating characteristics and resistance to heat, cold, humidity and chemicals—characteristics found in *all* Micarta plastics. Both small and medium size forms can be economically made from Micarta "444" for small-run production jobs.

Micarta "444"—a phenolic resin with a fabric base—is easily formed on inexpensive and quickly-constructed plastic or wooden dies. A simple arbor press with only 100 pounds per square inch pressure can do the job handily. Micarta "444" can be formed or bent into a variety of shapes from flat, cured sheets with perfect uniformity (see examples above).

Micarta "444" has already found many uses in radio and communications equipment. How many can you find in your own product designs? Your nearest Westinghouse office will be glad to explore its possibilities with you. Or write Westinghouse Electric Corporation, P. O. Box 868, Pittsburgh 30, Pa. J-94667

JUST HEAT . . . premolded and cured sheets are heated uniformly on both sides by infrared lamps for specific time.

TRANSFER . . . heated sheet is then quickly placed in inexpensive wood mold in arbor press or where pressure can be applied to mold.

AND FORM . . . pressure of about 100 psi is applied and shape cooled briefly in mold.

Westinghouse
PLANTS IN 25 CITIES . . . OFFICES EVERYWHERE

... one of many Westinghouse contributions to progress in electronic and communications equipment design

Micarta "444" is one of many Westinghouse products developed especially to meet engineers' demands for their new designs.

Here is a quick check list of some important Westinghouse developments . . . what they are, where to use them, what they will do. Like Micarta, each possesses characteristics giving designers greater freedom and flexibility.

Your nearest Westinghouse office can give you complete data on any of these exceptional communications products. Ask for the book number shown in parentheses on each item.

QUICK CHECK LIST OF SOME WESTINGHOUSE COMMUNICATIONS PRODUCTS

MATERIALS

Hipersil Cores . . .

Ready-to-assemble Hipersil cores have $\frac{1}{3}$ greater flux-carrying capacity and eliminate time-wasting stacking of tissue-thin laminations by hand. (B-3223-A)

Tuffernell Insulating Materials . . .

Developed during 50 years of field experience, Westinghouse "Tuffernell" insulating materials supply the *right* grade needed for numberless communications jobs. (B-3322-A)

Solder-Seal Prestite . . .

New high-strength Zircon Prestite offers remarkable versatility for communications products . . . it has low loss, high resistance to thermal and mechanical shock and can be supplied with standard Solder-Seal for true hermetic joining to metals. (B-3244)

PARTS AND ASSEMBLIES

Inerteen Capacitors . . .

Light weight, small volume and high reliability are features of Inerteen Capacitors for d-c service at 400 to 250,000 volts. Inerteen—the liquid dielectric is noninflammable . . . non-explosive. (B-3300)

Electronic Tubes . . .

Uniform, trouble-free, long-life service is built into every electronic tube in the Westinghouse line . . . Pilotrons, Kenotrons, Phototubes, Thyratrons and Ignitrons. (SP-204)

Instruments . . .

Westinghouse instruments range from miniature panel size to 4-foot boiler room indicators for all types of mountings. (B-3283)

Thermostats . . . Heaters . . .

If it takes electric heat, Westinghouse can help solve the control problem with a well-stocked line of thermostats that will handle any job up to 650° F. The tiny thermostat illustrated is for final temperature control in a crystal oven. (B-3344)

Dynamotors, Motors and Blowers . . .

Smooth, functional design gives these rotating components high flexibility for radio equipment. Light weight and compactness are the keynotes in the design of these long-lived devices. Available for a wide range of frequencies and voltages. (B-3242)

FAMOUS KENYON T-LINE TRANSFORMERS

BORN IN THE EARLY 1930'S...

We, at Kenyon, take a good deal of pride in our famous **T-LINE TRANSFORMERS**. Similar units are now produced and advertised by many of our competitors who long ago realized that the **T-LINE Housing** was a superior Housing in many respects—outdating by years the unpotted open-type Transformers produced by other Transformer Manufacturers.

Additional features of the famous

KENYON T-LINE

are:

- *Excellent Appearance*
- *Universal Mountings*

Mounting centers remain exact because they are die-punched all at the same moment in a single operation.

- *A Manufacturer's Dream*

Because they provide an excellent electrical and mechanical design that can be made cheaply from plentiful materials.

Kenyon is extremely satisfied with its outstanding engineering developments. The **KENYON T-LINE** case when produced in the early 1930's was years ahead of its time.

Our engineers are indeed proud to be the originators of such a popular design and point to its duplication with pride.

Kenyon engineering intends to maintain its place as a pioneer in the continued development of outstanding Transformer Equipment.

NO BUBBLE!

NO TROUBLE!

Production vacuum checking of Marion Glass-to-Metal Hermetically Sealed Electrical Indicating Instruments is no haphazard operation . . . After sealing in our dehydrating rooms, the instruments are submerged in glass jars which are partially filled with alcohol. A vacuum of 25 inches is drawn in accordance with newest JAN-1-6 specifications. During the test we watch for air bubbles — no bubble means no trouble. Spot checks for a period of four hours are made in a 29 inch vacuum.

The testing apparatus, illustrated above, is a Marion development, and demonstrates our sincerity of purpose in producing hermetically sealed instruments. We take nothing for granted — we neither suppose nor assume. Because imperfectly sealed instruments entrap condensation, we make certain that every hermetic instrument bearing our name is — perfectly sealed.

Marion Glass-to-Metal Truly Hermetically Sealed 2½" and 3½" Electrical Indicating Instruments

Write for our new, 12-page brochure. Manufacturers and users of radio and electronic equipment are invited to inquire into the advantages of Marion Glass-to-Metal Hermetically Sealed Instruments for postwar use.

304-H

Gammatron

Here's a low voltage—high current tube with superior mechanical strength!

Heintz and Kaufman engineers have developed the new 304-H Gammatron in response to the demand for a low voltage—high current tube possessing greater mechanical strength than the earlier type.

Short, stocky construction and other improvements give the new 304-H a degree of ruggedness which will surpass your expectations. Moreover, this added strength has been achieved without the use of internal insulators.

Although we designed this new Gammatron primarily for ability to withstand bumps, shocks and vibration, certain electrical improvements have also been obtained. The result is a tube

which will have widespread use in electronic heating applications, and as a gate or keyer tube. Its ruggedness, and consequent longer life, materially reduces operating costs.

For data on the electrical characteristics and price of the 304-H Gammatron, please write to

UNEXCELLED FOR HIGH TEMPERATURE APPLICATIONS...

CAN TYPES 25P

Two standard types, one for 105° C. and one for 95° C. continuous operation. Other ratings available.

HERMETICALLY SEALED IN GLASS TUBES

Famous Sprague glass-to-metal end seals. Extended construction gives maximum flash-over distance between terminals.

...ideal for higher ratings in smaller sizes at lower temperatures

Sprague Capacitors impregnated with the exclusive VITAMIN Q impregnant make possible the use of much smaller units—with a substantial safety margin—on numerous high-voltage, high temperature applications ranging from transmitting to television. Where high temperature is not a factor, their unique characteristics assure materially higher capacity ratings for a given size.

Type 25 P VITAMIN Q Capacitors operate satisfactorily at thousands of volts at ambient

temperature as high as 115° C. Insulation resistance at room temperature is *more than 20,000 megohms per microfarad*. Throughout the temperature range of +115° C. to -40° C. they retain all virtues of conventional oil-impregnated capacitors.

WRITE FOR NEW CATALOG

Sprague Catalog 20—just off press—brings you details on VITAMIN Q Capacitors in both can and glass tube types as well as dozens of other paper dielectric types for today's exacting uses.

RESONANT LOUDSPEAKER ENCLOSURE DESIGN

Simplified Procedure to Determine the Proper Dimensioning for Vented or Reflex Enclosures

by **SGT. FREDERICK W. SMITH, JR.**
U. S. Army Signal Corps

Figure 1
Cross section of a resonant-loudspeaker enclosure.

THE resonant type of loudspeaker enclosure is commonly encountered in a high-fidelity reproducing or monitoring system and is described commercially as a vented, tuned or reflex enclosure. Its construction is shown in Figure 1 and consists of a cabinet completely enclosed except for a *release* opening or vent of any shape located near the loudspeaker opening.

The electro-acoustical equivalent of such an arrangement is shown in Figure 2. L_s, C_s and R_s are constants due to the loudspeaker diaphragm mass compliance and damping, while R_a and L_a represent the effects of the air loading on the exterior side of the loudspeaker diaphragm. C_v represents the acoustical capacitance of the enclosed volume of

air coupled to the interior side of the loudspeaker (Figure 1), while the acoustical inertance, L_o , shunting C_v , is the result of the mass of air contained in the release opening. This opening is usually constructed to equal in area the radiating surface of the loudspeaker diaphragm as originally specified by Thuras.¹

The improvements in low-frequency response obtained through the addition of the tuned circuit, C_v and L_o , to the system have been described pre-

viously,^{2,3} and will be only briefly discussed here.

C_v and L_o are proportioned to resonate at the same point as the effective mass and compliance of the loudspeaker diaphragm, reducing the peak in diaphragm excursions and the output directly radiated which normally occurs at this point. Also, since the phase difference between the volume currents in L_o and those generated at the immediate rear of the loudspeaker may be as much as 180° , the

The views expressed in this paper are solely those of the writer and do not reflect the opinion of, or constitute a verification by, the U. S. Army Signal Corps.

²Carson, Chittick, Cole and Perry. *New Features in Broadcast Receiver Design*, RCA Review; July 1937.

³H. F. Olson. *Elements of Acoustical Engineering* (Acoustic Phase Inverter; ch. 7, 11), D. Van Nostrand.

Figures 2 (above) and 3 (below)

Figure 2. Equivalent circuit of a resonant-loudspeaker enclosure. Figure 3. Resonant frequencies and displaced volumes for loudspeakers of various sizes. Curve A represents the frequency range in cps; curve B, the volume displaced in cubic inches.

Figures 4 (left, below) and 5 (right, below)

Figure 4. Loudspeaker dimensions, S , R and r . D , nominal loudspeaker diameter; R , actual radius of diaphragm in inches; S , slant height of diaphragm in inches; and r , voice coil radius in inches. Figure 5. Enclosure with extended release opening.

sound issuing from the release opening will reinforce that directly radiated.

Subsidiary series resonances between the effective reactances of the loudspeaker diaphragm and the enclosure elements may also occur since L_s and C_s combined will be inductive above their resonant frequency while the combination of C_v and L_o will be capacitive. All of these factors tend to level and extend the response of such an enclosure in the range below 150 cps.

A primary design consideration, therefore, is a knowledge of the loudspeaker resonant frequency which is necessary to properly resonate the enclosure. Figure 3 shows the usual range of resonant frequencies encountered in loudspeakers of various sizes. The exact value may either be measured or obtained from the manufacturer.

A second consideration is the area required for the release opening. As mentioned above, this is made equal to the actual radiating area of the loudspeaker so that

$$\text{Release opening area} = \pi S(R + r) \quad (1)$$

where: S = slant height of the loudspeaker diaphragm
 r = voice coil radius
 R = radius of diaphragm

S is measured from the voice coil to the corrugations at the edge of the loudspeaker cone, while R is measured from the loudspeaker axis to the same point as is shown in Figure 4. $2R$ will be considerably less than the nominal diameter of the speaker.

The initial enclosure volume, V ,

⁴C. E. Hoekstra, *Vented Loudspeaker Enclosures*, Electronics; March, 1940.

⁵H. F. Olson, *Elements of Acoustical Engineering*, (Inertance Of An Open Pipe With Large Flanges, ch. 5, 11).

obtained by equating the expressions for the reactances of C_v and L_o , which are equal at resonance, and solving for V_e , as originally proposed by Hoekstra.⁴

As will be shown later, this initial volume must be modified before V_e , the final enclosure volume, and consequently the enclosure dimensions are determined.

Thus, the capacitive reactance of an enclosed volume is

$$X_{cv} = \frac{\rho c^2}{\omega V_e} \quad (2)$$

where: V_e = the initial enclosure volume
 ρ = density of the medium
 c = velocity of sound in the medium
 $\omega = 2\pi f$
 f = loudspeaker resonant frequency

and the reactance of the mass of air in the release opening is⁵

$$X_{Lo} = \left[\frac{\omega \rho}{\pi (R')^4 k^3} \right] K_1 (2kR') + \frac{\rho l \omega}{\pi (R')^3} \quad (3)$$

where: l = release opening length
 ρ = density of medium
 $\omega = 2\pi f$
 f = loudspeaker resonant frequency

(Continued on page 77)

CALIBRATING INSTRUMENTS FOR USE IN VACUUM-TUBE MANUFACTURE

by EUGENE GODDESS

Special Projects Engineer
In Charge of Quality

North American Philips Co., Inc.

Figure 1

Primary equipment used to calibrate a secondary standard meter for mass tube production tests. *A*, voltmeter being calibrated; *B*, voltbox; *C*, fixed resistor; *D*, variable resistor; *E*, galvanometer; *F*, standard cell; *G*, current box; and *H*, potentiometer.

IN mass production of vacuum tubes the problem of measuring attributes which determine the product's characteristics is quite complex, since a number of instruments are often used simultaneously.

For example, in measuring the light output of a c-r tube, the meters involved are: (a)—microammeter (for measurement of photovoltaic current); (b)—grid voltmeter; (c)—heater voltmeter; (d)—heater-current meter; (e)—first-anode voltmeter; (f)—second-anode voltmeter; and (g) third-

anode voltmeter (in accelerator type tubes).

Accuracy of measurement, therefore, depends on the accuracy of calibration of the test-set meters. Improperly calibrated meters can cause:

- (a)—Good tubes to be rejected.
- (b)—Bad tubes to be accepted.
- (c)—Quality to be indeterminate.

The usual procedure is to have a set of portable standard meters which are used to calibrate the test-set meters. These portable (or working) stand-

ards are calibrated by comparison to a set of secondary standards which are kept in a fixed position in the meter laboratory. The secondary standards are calibrated directly against primary standards consisting of a standard cell and a calibrated potentiometer. Primary equipment used to calibrate a secondary standard meter is shown in Figure 1, and in Figure 2 we have the circuit diagram for the precision equipment.

Use of Primary Standards

A number of batteries (emf in Fig-
TUBE PRODUCTION TESTS

IN TUBE MANUFACTURE
 ALL SMALL DETAILS ARE **LARGE**
 TO *Federal*

From slender filament to anode block . . . *all* tube construction details, however small, are important to Federal. That is why this experienced and longtime manufacturer uses the illustrated high-magnification metallograph as part of its test equipment for checking raw material quality.

An example is the micro-photo inset. Here is shown oxide-free, high conductivity copper used for copper-to-glass seals . . . after the material has been reduced to a fine grain, non-porous structure through Federal's special metal-processing methods.

But whether copper, molybdenum or tungsten . . . they all are subjected to the same exclusive treatment and put through the same searching scrutiny . . . assurance that only the finest materials go to make up Federal tubes.

This exacting test is another good reason why Federal tubes are better tubes. Transmitting, rectifier, industrial power . . . they have a reputation that is deserved because they are *built to stay*.

Federal always *has* made better tubes.

Federal Telephone and Radio Corporation

Newark 1, N. J.

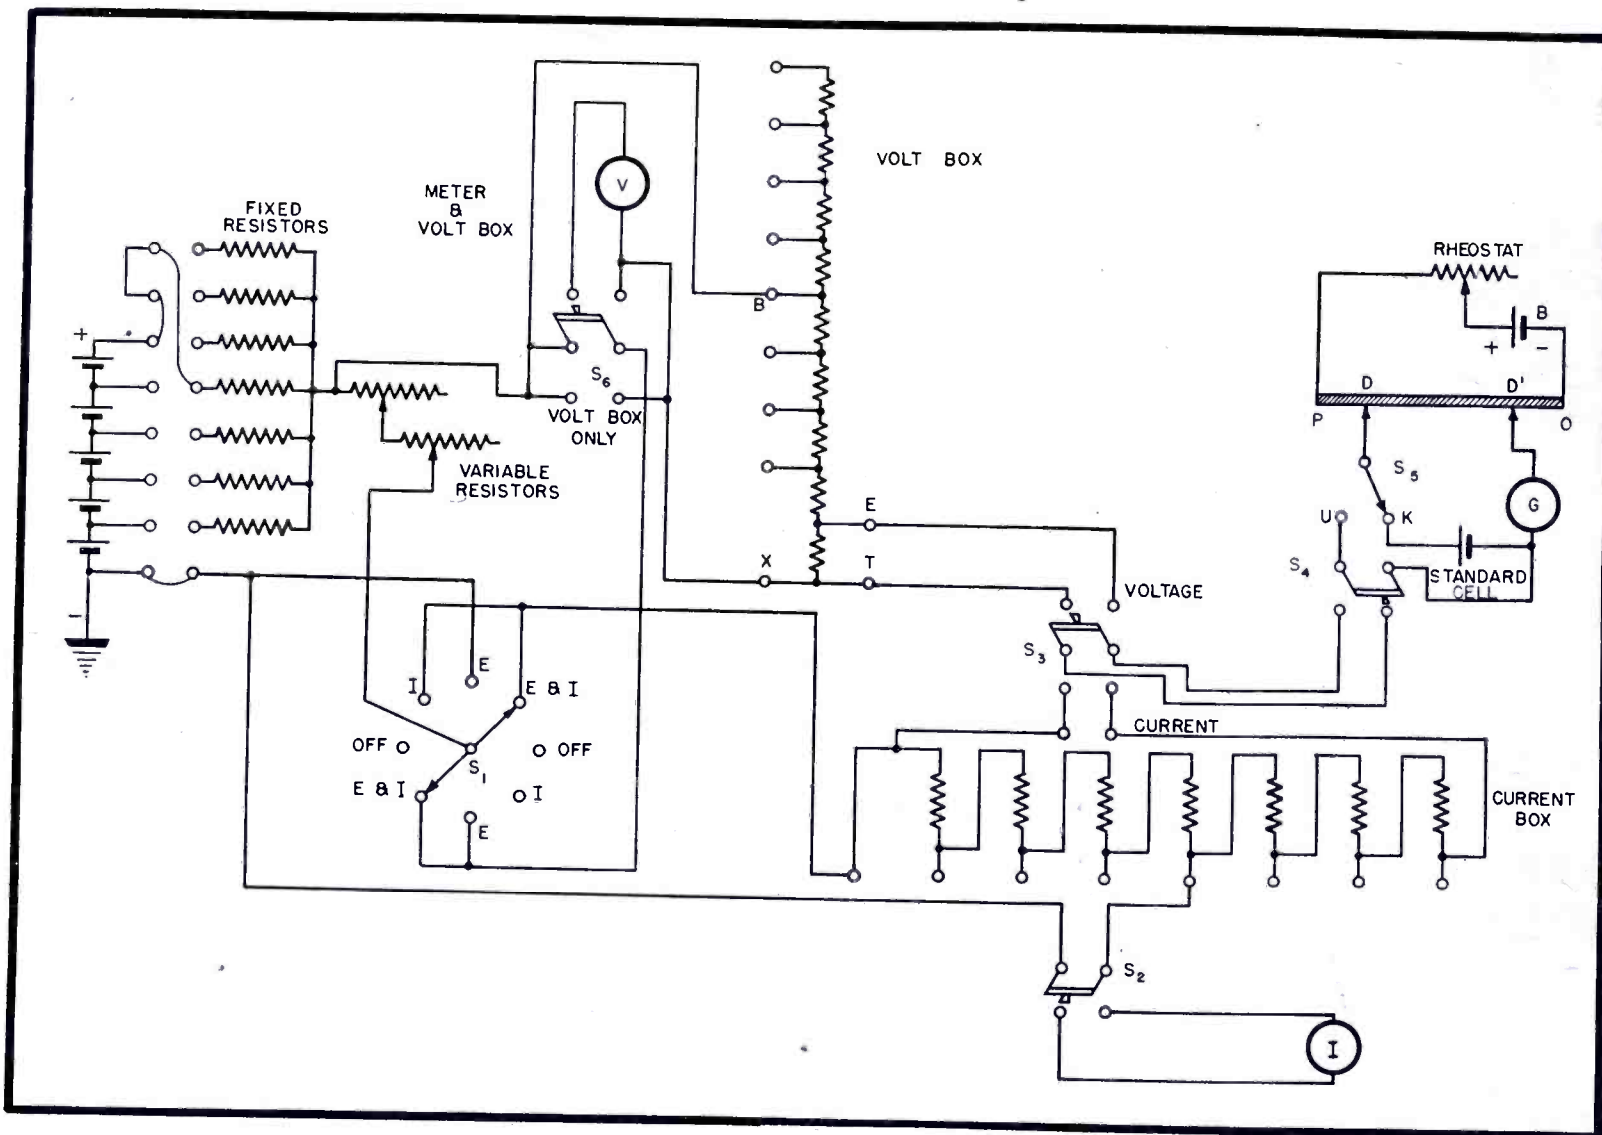

Figure 2
Instrument setup use in calibration of precision equipment. S_2 must be closed for simultaneous measurement of E and I .

ure 2) act as a source of potential which is placed across a network composed of fixed and variable resistors.

If a current meter is to be standardized the current through the resistors is placed through meter I , by means of suitable switches, S_1 and S_2 , and through a precision fixed resistor in form of a current box. A known fraction of the voltage drop in the current box is then placed across the potentiometer using switch S_3 in the current position, closing switch S_1 , and placing switch S_6 in position U .

Standardizing Voltmeter

If a voltmeter is to be standardized, the potential across the variable resistor is placed across the meter V and a voltbox by closing switch S_6 as indicated. A fraction of the voltage across the voltbox is then placed across the potentiometer by placing switch S_3 in the voltage position, closing switch S_4 , and placing switch S_5 in position U .

A potentiometer, as indicated by the line PO in Figure 2, is a conductor of uniform resistance per-unit-length. Connected in series through a rheostat, battery B causes a steady cur-

rent to flow through PO and the voltage drop is a direct function of length.

Standard Cell Application

Standard cell, SC , is connected across DD through a sensitive galvanometer, G , so its current flows opposite to the working current from battery B . The rheostat is varied to make the battery, B , current just equal to the *standard-cell* current as shown by a galvanometer null indication, thereby standardizing the working current. To compare an unknown voltage to that of the standard cell, the unknown voltage is switched into the circuit by moving switch S_6 from K to U . The potentiometer is then reset for a galvanometer null reading by varying the distance DD .

In practice, the distance DD is set to an ohmic resistance 1,000 times the potential of the standard cell as certified by its manufacturer.

Since each division of DD represents a potential difference of 1 millivolt, once the distance DD has been set to a galvanometer null, the unknown is read directly in millivolts.

Suppose it is necessary to calibrate

a 0 — 500 volt voltmeter, V , at its 350-volt deflection. The meter is connected in parallel with the voltbox, across a variable supply and sufficient voltage is applied to deflect the meter to read some given amount, i.e., 300, 350, 400 volts, etc. The question then is: What is the true voltage across the meter which makes it deflect to read 350 volts?

True Voltages

To answer this question, a known proportion of the voltage across the voltbox (i.e., across the meter) at BX is fed to the terminals marked ET . Suppose the fraction is $1/500$ of BX , and suppose the voltage fraction is measured on the potentiometer PO as 694 millivolts. Consequently the voltage across the voltbox is $500 (.694) = 347$ volts. In other words, the meter required 347 volts for a deflection of 350 volts on its scale, and hence is calibrated at this one point of its scale. Comparison of secondary standards should be made with the primary standards at least once every two weeks.

THE BENDIX TG-16 FIXED STATION TRANSMITTER

**Traditional Bendix quality in the
low power field.**

**The latest addition to the Bendix
line of ground station equipment**

A worthy companion to higher powered Bendix equipment, the TG-16 transmitter is designed to the same standards of performance that have made Bendix Radio equipment "STANDARD FOR THE AVIATION INDUSTRY." Characterized by straightforward design, conservative ratings, and low power consumption, it is ideally suited for installation at secondary airfields where simple, reliable operation is a necessity.

The TG-16 is a unit-type, multi-channel transmitter for airways communication and point-to-point operation at

high frequency and V.H.F. A low frequency RF channel for control tower or automatic radio beacon service can be supplied where required. The output of the transmitter is 100 watts at V.H.F. At lower frequencies it supplies 190 watts for radio telegraph and 160 watts for radio telephone. Simple remote control facilities are available for distances up to 1000 feet.

For further information on the new Bendix TG-16 Fixed Station Transmitter, write for your copy of our catalogue.

STANDARD FOR THE AVIATION INDUSTRY

An Analysis of a Pulse Counting Circuit Which is Not Limited by Pulse Repetition Rate

ELECTRONIC COUNTING

by MAX WEBER

IN television and the allied arts, a need often arises for a circuit which will enable pulses to be counted, or which will have an output whose frequency is some fraction of the input frequency. This need makes itself apparent in television equipment (for marker *pips*), and frequency meters, navigational aids, and many other types of electronic equipment.

The counting of pulses may be accomplished by feeding them to a circuit which will have one output pulse every time a certain number of input pulses has been impressed. The number of pulses and frequency of pulses which can be counted by a circuit of this type will be limited. Instability of operation usually results if attempts are made to count too many pulses at once. Although this would appear to be quite a handicap, actually this obstacle is quite easily overcome by using several counting circuits in

cascade, if necessary. Clearly, the final number of pulses counted is the product of the numbers which were counted by each circuit. For example, if each circuit gives one output pulse for each ten input pulses, and only four such stages are used, the final stage will have one output for each 10,000 original input pulses.

Figure 2 is a schematic representation of the counting circuit to be analyzed in this paper*. Should the input signal be of insufficient amplitude to produce satisfactory results, one or

more stages of amplification should be used prior to the introduction of the signal to the circuit.

The operation of the counting circuit will be seen to depend upon the charging of condensers in series. It will therefore be necessary to review briefly a circuit, such as Figure 1, which shows two condensers C_1 and C_2 placed in series across a source of potential E_B .

When switch S_1 is closed, the battery voltage E_B appears across C_1 and C_2 . If the potential which finally appears across C_1 and C_2 be called E_1 and E_2 respectively, it is apparent that

$$E_B = E_1 + E_2 \quad (1)$$

The relationship between the charge and the voltage in a condenser is

$$Q = CE$$

where Q is measured in coulombs, C in farads and E in volts. Since C_1 and C_2 are in series,

$$Q_1 = Q_2 = C_1 E_1 = C_2 E_2$$

$$\text{or } E_1 = \frac{C_2 E_2}{C_1} \quad (2)$$

Substituting equation 2 in equation 1

$$E_B = \frac{C_2 E_2}{C_1} + E_2 = E_2 \left(\frac{C_2 + C_1}{C_1} \right)$$

$$\text{or } E_2 = E_B \left(\frac{C_1}{C_2 + C_1} \right) \quad (3)$$

$$\text{Similarly } E_1 = E_B \left(\frac{C_2}{C_2 + C_1} \right) \quad (4)$$

From equations 3 and 4, it may be seen that the voltage across either

NEW VACUUM TUBE FREQUENCY METER..

INDICATES
800 CYCLES
± 2 CYCLES!

Model 33-VTF,
with cover removed

Model 33-VTF can be mounted in several ways—rack and panel installation shown is typical. Only the meter appears in front—electronic unit may be mounted either on same panel or at some remote location.

MODEL 33-VTF, now released for commercial use, makes available the ruggedness and exceptional accuracy of the vibrating reed frequency meter. It measures specific bands such as 760-840 cps or 1140-1260 cps.

Again, J-B-T engineers have extended the useful range of the vibrating reed frequency meter—through use of a simple, practical electronic circuit. A vacuum tube multivibrator divides the incoming frequency by the proper integer, and shows the result on the widely used standard 400 cycle meter.

Harmonics of accidental frequencies or unusual wave form do not affect the response where the speed of the inverter or other frequency source is in the approximate range being measured.

Model 39-VTF, Laboratory Type, not shown, has an input impedance of 500,000 ohms, and uses regular line current for power supply. This model, through use of a multiplier switch, measures frequencies 1, 2, 3, 4, 6 and 9 times the basic range of 380-420 cycles.

J-B-T

ELECTRONIC COUNTER

(Continued from page 42)

condenser varies inversely with the size of the condenser, since these equations could be written as

$$E_2 = E_B \times \frac{1}{C_2 C_1 + C_2} \left(\frac{C_1 C_2}{C_2 C_1 + C_2} \right) \quad (3a)$$

$$E_1 = E_B \times \frac{1}{C_1 C_1 + C_2} \left(\frac{C_1 C_2}{C_1 C_1 + C_2} \right) \quad (4a)$$

Consider now the circuit to be used for a counting device, or a frequency divider, as shown in Figure 2.

The actual portion of the circuit which does the counting consists of tubes V_1 and V_2 , and condensers C_1 and C_2 . It is therefore this portion upon which most of the emphasis will be placed during this discussion. The remainder of the circuit is an ordinary blocking oscillator, one function of which is to provide a discharge path for C_2 . The necessity for providing some discharge path for C_2 will be shown after an explanation of the theory of operation of this circuit has been presented. The blocking oscillator is a simple and frequently used output stage for this type of counting circuit, although many other devices have been used successfully for the same purpose.

The circuit shown is a simplified one which includes only the principal components. Values are not given since they will depend upon the frequencies involved. Relative values of condensers C_1 and C_2 will depend upon the number of pulses the circuit is intended to count. Further in the discussion it will be shown that a definite ratio exists between the value of C_1 and that of C_2 . The selection of the vacuum tubes to be used is optional. It is suggested, however, that one tube such as the 6H6 be used for V_1 and V_2 . The setting of P_1 must be such that V_3 is biased below cut-off.

Let us assume that the input to this circuit is a square wave having some definite pulse repetition rate, as shown in the first part of Figure 4.

It is not necessary that the input be a square wave. This circuit will operate efficiently if the input is a sine wave or some other wave which is quite regular in nature; and, even if the input waveform is quite irregular in shape or repetition rate, satisfactory counting is possible. One of the advantages of using this circuit is that it will be able to count pulses regardless of their irregularity of shape or repetition rate. However, in order to simplify the explanation and the resultant wave shapes, the input here

It will be assumed to be a square wave with a constant repetition rate.

Let us consider the condition of C_1 and C_2 after one cycle of the square wave has passed. It will be noted that on the positive half-cycle V_2 is able to conduct (since the plate is positive with respect to the cathode) and C_1 and C_2 are then in series with each other across the input voltage. On the negative half-cycle, however, V_1 is the tube which is capable of passing current and C_1 is the only effective capacitance then across the input voltage (ignoring any stray capacitance and interelectrode capacitance in V_1).

After the positive half of the cycle has passed, C_1 and C_2 will both be charged through V_2 as shown in Figure 3a. When the negative half of the cycle is applied, C_1 will discharge (or charge in the opposite direction) through V_1 . C_2 will remain charged as it was previously. Figure 3b shows the condition of C_1 and C_2 when the negative peak of the applied signal has passed. It will be noted that the charge on C_2 has not changed. The cathode of V_2 is positive with respect to the plate so that this tube cannot conduct to allow a path of discharge for C_2 . After one cycle of the applied signal has passed, the voltage across C_2 may be represented as

$$E_M \left(\frac{C_1}{C_1 + C_2} \right) = r E_M \quad (5)$$

where E_M is the peak of the applied voltage, and r is the ratio of

$$C_1 \text{ to } (C_1 + C_2).$$

This equation is not quite exact, as we have failed to consider the voltage across V_2 . However, the voltage across the diode will be quite small, and consideration of it would unnecessarily complicate the discussion without increasing the accuracy of the calculations appreciably.

Multiple Cycle Effects

Equation 5 expressed the voltage across C_2 after the first cycle (or else) of the applied voltage has passed. It will be of value to determine what voltage exists across C_2 after the application to this circuit of any given number of cycles. This may be achieved by determining the voltage present after the passage of two or three cycles, and then arriving at a general equation which will be applicable for any number of cycles.

When the second cycle of the incoming signal is applied, C_1 has discharged, but the voltage shown in

THE BRUSH DEVELOPMENT COMPANY

1400 PERKINS AVENUE CLEVELAND 14, OHIO

Figures 3 (left), and 4 (below)

Figure 3. Condition of condensers C_1 and C_2 : (a), after positive portion of applied signal; (b), after negative portion of applied signal. Figure 4. Theoretical wave - shape relationships.

equation 5 is still present across C_1 . The actual peak voltage now impressed on the circuit will be

$$E_M - E_1 = E_M - r E_M \quad (6)$$

The voltage present across C_2 after the second cycle of the incoming signal has passed will be the sum of the voltage given by equation 5 and a portion of the impressed voltage shown in equation 6. This may be expressed as

$$E_2 = E_1 + (E_M - E_1) r \quad (7)$$

or, substituting equation 5 in equation 7,

$$E_2 = r E_M + r E_M - r^2 E_M$$

$$E_2 = E_M (2r - r^2) \quad (8)$$

This may also be written as

$$E_2 = E_M [1 - (1 - r)^2] \quad (9)$$

The reason for using the form of equation 9 for equation 8 will be apparent shortly.

When the third cycle of the incoming signal has been applied, the voltage then appearing across C_2 will be the sum of E_2 and a portion of the difference between E_M and E_2 . This may be expressed as

$$\begin{aligned} E_3 &= E_2 + r (E_M - E_2) \\ &= E_M [1 - (1 - r)^2] \\ &\quad + r \{E_M - E_M [1 - (1 - r)^2]\} \\ &= E_M [1 - (1 - r)^2 + r (1 - r)^2] \\ &= E_M [1 - (1 - r)^2 (1 - r)] \end{aligned}$$

or

$$E_3 = E_M [1 - (1 - r)^3] \quad (10)$$

From equations 5, 9 and 10 the general relationship is

CRYSTAL OSCILLATORS

IN F-M AND TELEVISION

by **SIDNEY X. SHORE**

Consulting Engineer

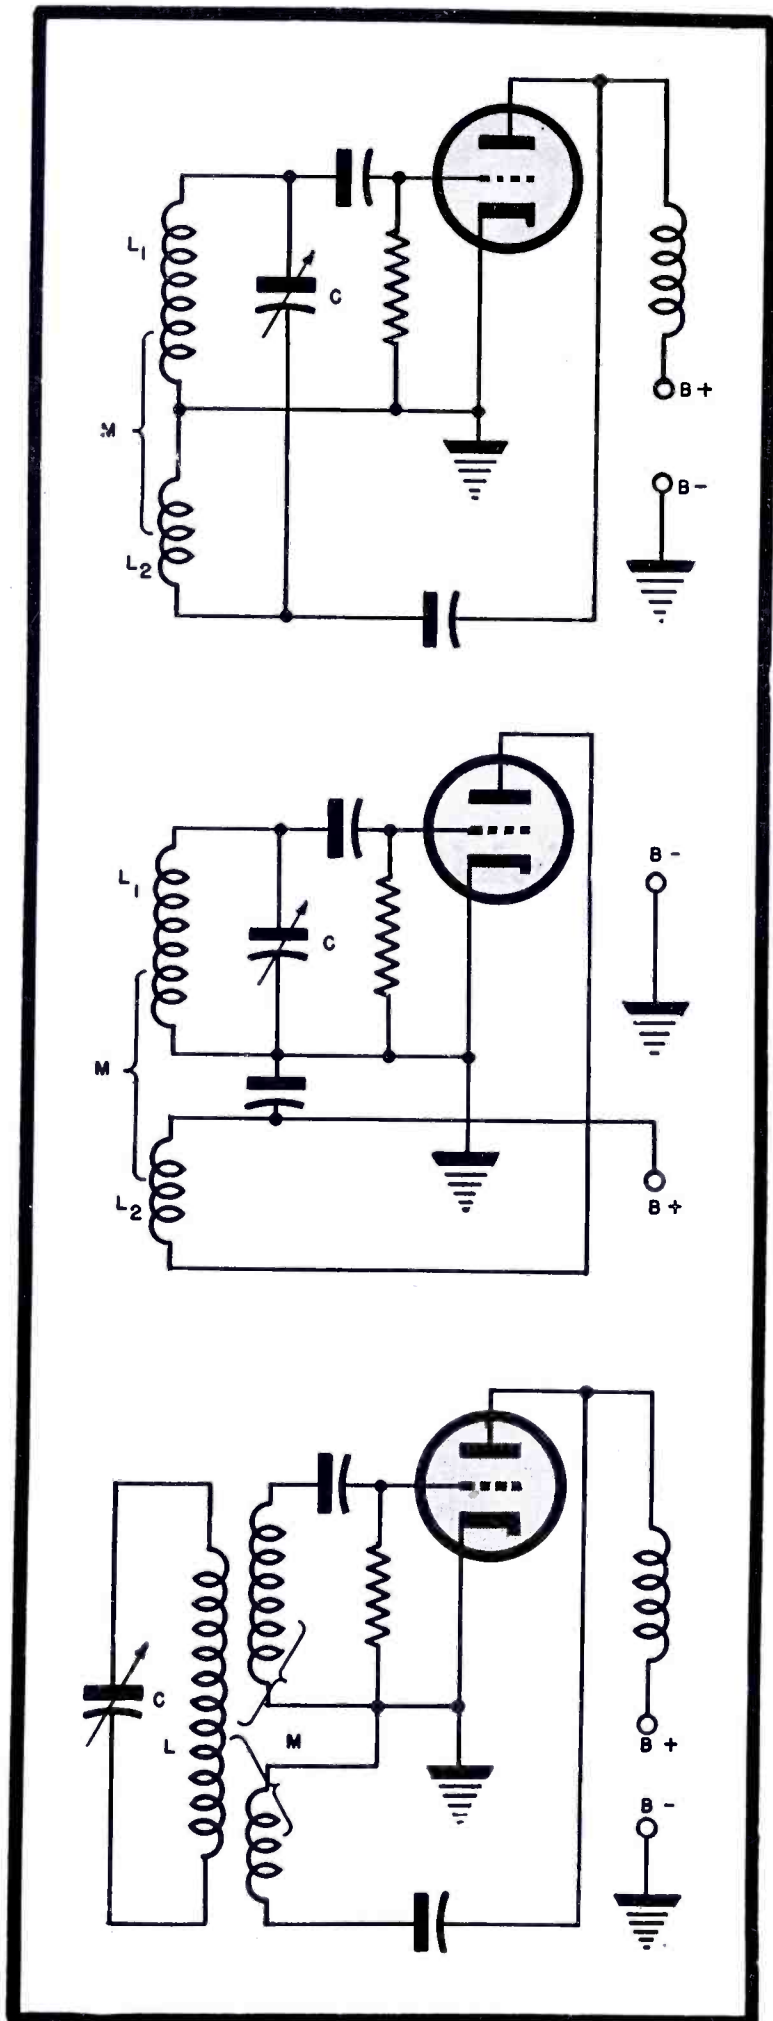

[Part One of a Series]

WITH circuit simplification and the use of a minimum tubes major requisites most superheterodyne oscillators, stability has become increasingly important, particularly at v-h-f. As with the new fm/television allocation the veryhigh frequencies are scheduled to become as important as the m-f broadcast band.

The general practise in designing wide-band f-m i-f systems is to make its response reasonably flat over a range of 200 kc to avoid the danger of clipping one of the sidebands of the modulated signal, especially

Figure 3

Inductively - coupled feedback oscillators (self-excited): At top, Hartley; center, plate-tickler; bottom, Meissner. Hartley and plate-tickler coil oscillators appear in most superheterodynes. These systems use lumped inductances and capacitances in combination with distributed capacitances and inductances associated with wiring, tubes and other components to establish oscillator frequency.

Figures 1 (above) and 2 (below)
Figure 1. The i-f resonance characteristic at the limiter of an f-m receiver. In Figure 2 appears the f-m discriminator characteristic; f_0 represents the beat between resting carrier frequency of station and local oscillator in the receiver.

Investigating the grain structure of a metallurgical subject, magnified 585 times.

Arming radio for war

MODERN GLOBAL WARFARE has subjected radio communication equipment to hitherto unheard-of forms of punishment. Not the least of these are extremes of shock and vibration, the enormous acceleration of high-powered aircraft take-offs and the abrupt deceleration of carrier landings.

Such service requires not only a high degree of excellence in design and fabrication, but also an infinite amount of research in the field of available materials and their behavior under varying conditions.

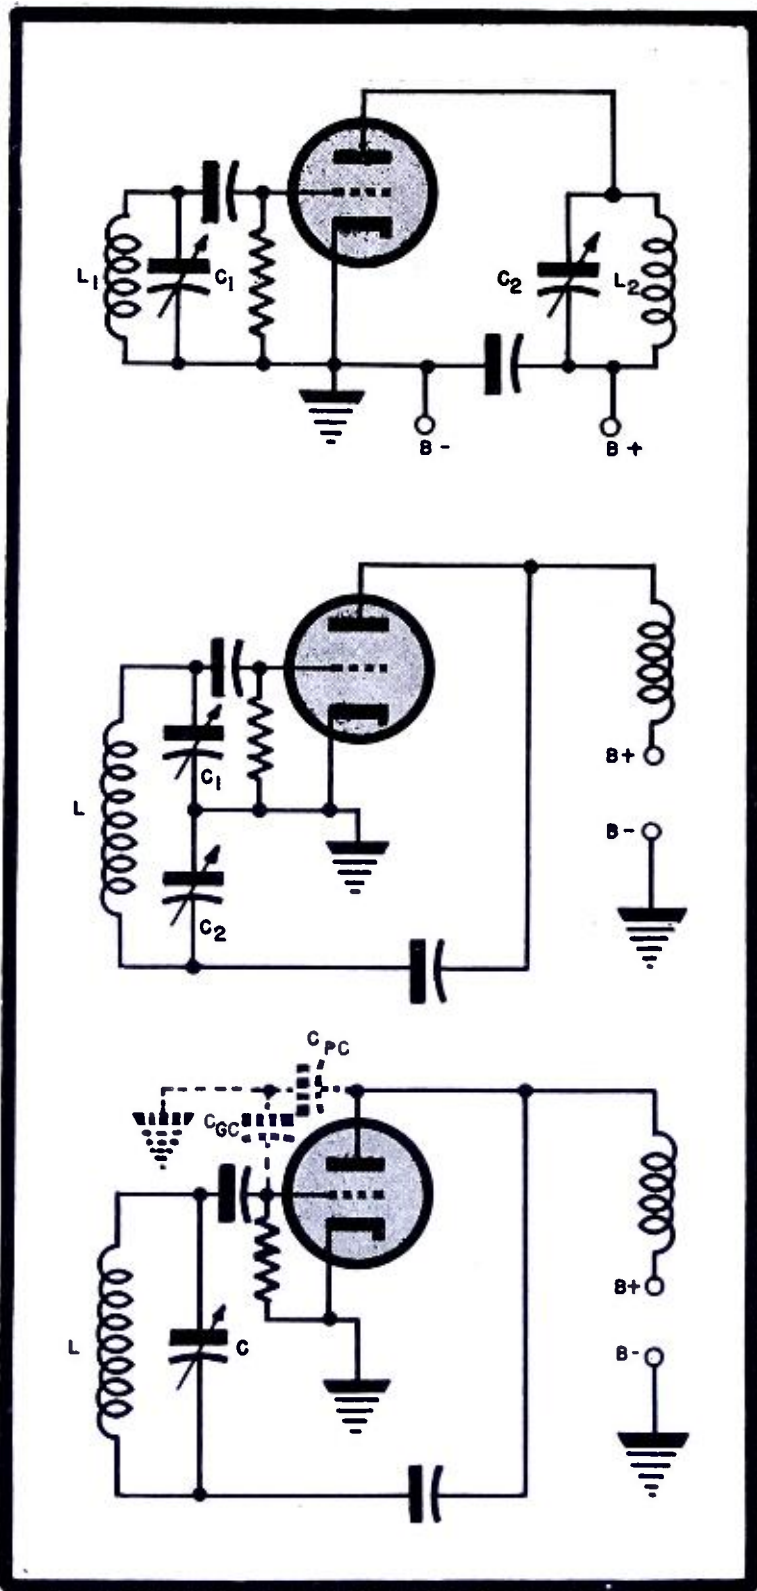

Collins chemical and metallurgical research has

played a very important part in developing the Collins communication transmitters and receivers which have proved so trustworthy in Military service.

The result of continuing research will be reflected in the Collins equipment available to commercial users after the war. Collins Radio Company, Cedar Rapids, Iowa; 11 West 42nd Street, New York 18, N. Y.

... IN RADIO COMMUNICATIONS, IT'S ...

Three types of capacity-coupled feedback (self-excited) oscillators: top, tuned-plate-tuned-grid; center, Colpitts; bottom, ultradion. In the t-p-t-g oscillator, the plate-grid capacity serves as the feedback path. The Colpitts circuit secures feedback via the proper sizes and ratio of C_1 and C_2 . In the ultradion circuit, the grid-cathode and plate-cathode capacitances are used in similar fashion as C_1 and C_2 in the Colpitts for proper phase feedback. Only one coil and capacitance are needed in the oscillating circuit and since no d-c must pass through coil, the lumped LC circuit can be replaced by a crystal. The resulting circuit is known as one form of the Pierce oscillator.

limiter effectiveness would be masked somewhat by the high audio level but this effect is definitely present.

It is obvious therefore that the need for oscillator stability is greater than ever before. In a television receiver, local oscillator drift will result in the same effects, just described on the sound channel and in image distortions on the video channel. At frequencies above 30 mc oscillator instability and drift may be eliminated in great measure by the use of low-temperature coefficient quartz crystals and suitably designed oscillator circuits.

In lower cost receivers where i-f systems may be peaked as much as possible to realize maximum gain with minimum tubes and circuits oscillator stability is particularly important if good quality is desired over a period of time at a single dial setting. Instability of oscillator components has resulted in the abandonment of push-button systems by the majority of manufacturers. Crystal-controlled oscillators offer the simplest solution to this problem.

In the high-fidelity a-m broadcast receiver oscillator instability can mar reproduction, unless the i-f system will pass a band considerably wider than the minimum required. But their interference from adjacent-channel stations becomes a serious problem.

Oscillator stability is exceedingly important in portable mobile equipment. Automobile radios should certainly be equipped with push-buttons to avoid dial twisting and fishing for signals while driving. And timing a-n and particularly f-m sets by ear without some visual resonance indicator prompts mistuning and resultant poor quality. Of course a visual tuning indicator in an automobile would be a hazard to driving safety. Therefore push buttons become a *must* in design. Under the grueling riding conditions with the attendant severe vibration and temperature changes oscillator stability again becomes a circuit necessity. The need for stable oscillators in marine equipment is also increasing. For marine operations and for other point-to-point applications where several spot frequencies may be used almost exclusively a stabilized crystal-controlled oscillator is the solution.

For single side-band transmission and suppressed carrier transmission extreme oscillator stability and accurate reinsertion of the proper carrier frequency are of paramount importance. To conserve space in the frequency spectrum as the need for more transmitters grows the art ma-

high-modulation levels, because of local oscillator drift. This widening of the pass band of the i-f is done at some expense of gain of the i-f system. If the pass band of the i-f system were able to accommodate a large oscillator drift, the discriminator characteristic, which departs from linearity just beyond the 150-kc pass band, will cause the highly modulated signals to become distorted as the detector voltage departs from proportionality to frequency deviation.

In Figure 1, we have the i-f resonance characteristic at the limiter of an f-m receiver; Figure 2 illustrates the discriminator characteristic, f_0 represents the beat between the resting carrier frequency of the station and the local oscillator in the

receiver. For the purposes of illustration let us assume that the resting carrier frequency of the broadcast station is 100 mc, and that the local oscillator frequency for this dial setting is 85 mc. The beat frequency or i-f will then be 15 mc. The width of the modulation band of a 100% modulated f-m signal would be 150 kc according to the present system.*

Of course, as long as there is enough voltage at the limiter grid to saturate the limiter there will be no deleterious effect due to this i-f clipping. At high-modulation levels, where this effect would occur, any increase in noise due to lessened

*A deviation in oscillator frequency of .03% will result in an F_0 beat of 25 kc.

Out of the War Came *BETTER* Insulation!

STRIKING progress in many lines during the all out war effort will have great value in the future and will pay back a part of the terrible cost of war.

Formica FF and MF grades developed during this time have introduced glass base laminated sheets to electrical engineers and have provided insulation of a new high quality in the laminated form.

Some of these grades are excellent high frequency insulators—comparable with ceramics—yet they maintain the easy machinability and workability of laminated parts. They can be punched, drilled, milled. Some of them have exceptional heat resistance for use in motor slot wedges and similar applications.

They will produce better electrical devices at lower costs in the years to come, and contribute in a small way to making a better world.

Engineering data on request.

FORMICA

Figure 5
The dynatron oscillator circuit. An additional resonant circuit may be inserted at point X. The oscillator will oscillate at the resonant frequency of both resonant circuits.

Figure 6
The transitron oscillator. Both the transitron and dynatron are negative-resistance oscillators. The transitron is much more stable than the dynatron. An additional resonant circuit may also be inserted at point X.

Figure 7
The equivalent circuit of a quartz crystal in an air-gap mounting. It will be seen that the crystal plate can be excited to resonate or oscillate over a narrow band of frequencies, depending upon the associated circuit elements; resonant frequency, f_R , is the series-resonant frequency and is a function of the equivalent L and C of the crystal element. Antiresonant frequency, f_A , is the parallel-resonant frequency.

turn toward these means for saving frequencies, and also power.

At present the magnetically- or inductively-coupled feedback oscillator (*Hartley and plate-tickler coil*) are used in most superheterodynes.

The *Meissner* oscillator is not used in receivers because it requires more complicated coil and its efficiency is no better than the previously mentioned types. These oscillators use lumped inductances and capacitance in combination with distributed capacitances and inductances associated with the wiring, tubes and other component parts to establish the oscillation frequency.

Other types of self excited oscillators utilize capacity-coupled feedback. Figure 4. The t-p-t-g oscillator utilizes the plate-grid capacity as the feedback path. The *Colpitts* circuit accomplishes feedback by the proper sizes and ratio of C_1 and C_2 . The *ultraudion* is an interesting circuit in that it utilizes the grid-cathode and plate-cathode capacitances in a similar fashion as C_1 and C_2 are used in the *Colpitts* circuit for proper phase feedback. It requires only one coil and capacitance in the oscillating circuit and since no d-c must pass through the coil it is a simple matter to replace the lumped LC circuit by a quartz crystal. The resulting circuit is known as one form of the *Pierce* circuit (Patent #2,112,863, issued to George W. Pierce). This interchangeability of lumped LC with a quartz crystal provides an ideal arrangement for most types of low-frequency or broadcast band push-button receivers.

Other types of oscillator circuits requiring only a single coil and condenser in the LC section are those utilizing negative resistance. In figure 5 we have the *dynatron* as disclosed in 1917 by Dr. Albert W. Hull. Figure 6 shows the *transitron* circuit, a much more stable type of oscillator than the *dynatron* and capable of many interesting effects.

All of the self-excited oscillators shown utilize a shunt LC circuit to determine the frequency of oscillation. A bridge type of oscillator circuit, which has been used to increase stability of self-excited oscillators, utilizes a series resonant LC circuit which is effectively in series with the feedback leg of the circuit. At series resonance of the LC combination maximum feedback occurs and oscillations are started.

It is possible to demonstrate analytically and graphically that there are many causes of oscillator instability.¹

The general expression for the fre-

- Filament Current 110 amps.
- Maximum Peak Inverse Voltage 2800 volts
- Maximum Peak Plate Current 9.0 ma
- Maximum Average Plate Current 1.5 ma

TYPE 2B25
AVERAGE CHARACTERISTICS

A recent development for the expanding Raytheon miniature tube line is the type 2B25 high-voltage, high-vacuum rectifier. This tube requires approximately 0.15 watts filament power, yet can deliver 1000V DC at 1.5 ma.

These characteristics make it applicable to various forms of electronic equipment in which its small size and rugged construction may be very desirable features. Furthermore, with proper precautions, the low filament power can easily be supplied from an oscillator if it is desired to rectify low radio frequency to obtain direct current power within the 2B25 voltage and current ratings. Plate and filament potentials can be turned on simultaneously without damage and heating is practically instantaneous—thus making this tube suitable for intermittent usage.

Other possible applications include operation as the rectifier in battery vibrator power supplies designed to supply the high voltage DC for small portable cathode ray oscilloscopes or special test equipment.

Raytheon type 2B25 and the many other types in Raytheon's complete line are precision-engineered and quality-built for utmost efficiency and maximum dependability. Look to Raytheon for the *best* in tubes for your postwar products!

VOTED TO RESEARCH AND THE MANUFACTURE OF TUBES AND EQUIPMENT FOR THE NEW ERA OF ELECTRONICS

SKIN EFFECT IN ROUND CONDUCTORS

by W. B. SHEPPERD

Army-Northwest Airlines
On Leave, E. E. Dept., North Dakota Agricultural College

MANY papers offering skin-effect calculations have been published, giving both empirical solutions covering a limited range, and rigorous solutions. However, having occasion to present this topic to a group of war-time trainees in radio work, the writer was unable to find any method that was lucid and simple enough to be used by technicians of limited mathematical training and which at the same time was reasonably accurate over a wide range. The

simplified formulas used in power-line work are correct only for comparatively low frequency, while the high-frequency formulas are inaccurate ex-

cept where depth of penetration slight.

To present to the trainees a method of calculating skin effect that would be simple and dependable, the method described in this paper was developed. Where the conductor is copper, only conductor diameter and frequency need be known to determine the increase in

•
Skin effect curves. $K = 6.08 d \sqrt{f}$ for copper; $7.98 \sqrt{\frac{\mu f}{\rho}}$ for any conductor; d = conductor diameter inches; μ = permeability, air = 1; f = frequency, kc; ρ = resistivity, microhm per cm cube. (Copyright, W. P. Shepperd)

 Nineteen hundred and forty-five

Because it was a bit more convenient in plotting, r_o/δ , rather than q , was used as the abscissa in constructing the curves, and under the name of K , r_o/δ is the calculated value used for entering the curves. K developed as follows:

$$\frac{r_o}{\delta} = \frac{d}{2} \left[2\pi \sqrt{\frac{\mu f}{\rho} \times 10^{-9}} \right]$$

$$= \pi d \sqrt{\frac{\mu f}{\rho} \times 10^{-9}}$$

where d is centimeters diameter, ρ ohm/cm cube, and f is cycles per second.

$$= \pi d \sqrt{\frac{\mu f}{10^3 \rho}} \quad \text{where } \rho \text{ is microhm/cm cube}$$

$$= \pi d \sqrt{\frac{\mu f}{\rho}} \quad \text{where } f \text{ is kilocycles}$$

$$K = 7.98 d \sqrt{\frac{\mu f}{\rho}} \quad \text{where } d \text{ is inches diameter}$$

This form of K is used because it is derived from properties expressed in the common handbook units used in this country.

Where the conductor is copper, K is still further simplified by substituting the permeability 1.000 and resistivity 1.724 microhm/cm cube:

$$K = 7.98 d \sqrt{\frac{1.000 f}{1.724}} = 6.08 d \sqrt{f}$$

with d in inches and f in kilocycles.

Equations upon which the curves are based give the ratio of the resistance and the internal inductance of the conductor at frequency of f kilocycles to the low-frequency or d-c resistance and inductance. Inductance due to the magnetic field outside the conductor is, of course, unaffected; the inductance to which the formula and curve apply is that due to the magnetic field inside the conductor. The equations in terms of q are:

$$\frac{R_r}{R_o} = \frac{q}{2} \left[\frac{\text{Ber } q \text{ Bei}' q - \text{Bei } q \text{ Ber}' q}{(\text{Ber}' q)^2 + (\text{Bei}' q)^2} \right]$$

$$\frac{L_r}{L_o} = \frac{4}{q} \left[\frac{\text{Ber } q \text{ Ber}' q + \text{Bei } q \text{ Bei}' q}{(\text{Ber}' q)^2 + (\text{Bei}' q)^2} \right]$$

In these equations $\text{Ber } q$ and $\text{Bei } q$ are the real and imaginary Bessel functions of the argument q , and $\text{Ber}' q$ and $\text{Bei}' q$ are the first derivatives of these functions. The values were obtained from tables by H. B. Dwight (Vol. 58, *Transactions of the AIEE*). All calculations were carried out to four significant figures to make the

(Continued on page 87)

SKIN EFFECT IN ROUND CONDUCTORS

(Continued from page 56)

resistance due to skin effect. For other materials a formula involving resistivity and permeability is given. From this result the curves give a multiplier to be applied to the d-c resistance and inductance of the wire. All theoretical considerations have been omitted from these instructions.

The basis for the curves is the solution by Bessel functions.¹ The following analysis shows the derivation of the curves.

Symbols used in the development are:

- δ = Depth of penetration of current in flat conductor of infinite depth. This is depth at which the current density becomes $1/e$ times its value at the surface.
- r_o = Outside radius of the conductor.
- f = Frequency, cycles per sec.
- μ = Permeability, air = 1.00.
- ρ = Resistivity.
- R_s = Skin resistance; resistance at frequency f of unit width \times length of conductor of infinite depth.
- R_o = D-c resistance of conductor.
- R_r = Resistance of conductor at frequency f .
- L_o = Internal inductance at low frequency or d-c.
- L_r = Internal inductance at high frequency.

- quency.
- d = Diameter of conductor.
- K = Abscissa used in curves.
- $q = r_o/\delta$ used in calculating curves.

Depth of penetration in a flat plate conductor of unlimited area is found to be:

$$\delta = \frac{1}{2\pi \sqrt{\frac{\mu f}{\rho} \times 10^{-9}}} \text{ cm} = \frac{1}{2\pi} \sqrt{\frac{\rho}{\mu f \times 10^{-9}}}$$

(cm depth, where f is cycles per second, ρ is ohms per cm cube, and μ is permeability referred to air as unity).

For copper, $\mu = 1$, $\rho = 1.724 \times 10^{-6}$;

$$\delta = \frac{1}{2\pi} \sqrt{\frac{1.724 \times 10^{-6}}{1 \times f \times 10^{-9}}} = 6.608$$

$$\sqrt{\frac{1}{f}} \text{ cm depth}$$

The numeric R_o/δ , the ratio of conductor radius to depth of penetration, appears in the equations for high-frequency resistance, in the form of the independent variable

$$q = \sqrt{2} \frac{r_o}{\delta}$$

Personals

WE have just received a war story of a radio man's heroism that we believe will be one of the greatest ever recorded. It's the story of Forrest Vosler, a sergeant who received the Congressional Medal of Honor from the late President Roosevelt.

From official records we learned that Vosler was wounded in the legs and almost completely paralyzed from the waist down, while on a flying fortress mission over Bremen. His radio equipment destroyed, he relieved the tail gunner who had also been hit; he fired the tail gun until hit again. This time he was struck in the shoulders and face and was blinded. Crawling back to the radio compartment he made frantic efforts to repair his radio gear. The fortress was losing altitude rapidly and SOS was imperative if any of the crew were to be rescued. Unable to see, and by sense of touch alone, he repaired the radio and sent the distress call.

With the ship losing altitude, it was necessary to throw everything overboard. As the pilot struggled to reach the English Channel, the plane dipped lower and lower, and it appeared as though the lightened fortress would drop in the sea. Vosler then made the appeal, now so famous in the Air Corps. He asked that he be thrown out to further lighten the stricken plane. His crewmates refused. The ship fell into the English Channel and shortly thereafter, the blinded Vosler heard a fellow crewmate floundering in the water. He slipped off the wing and felt around for him and pulled him back to the wing, holding him until they were rescued.

Today, Vosler, who is but 21, is back on the job. Despite the handicap of having lost one eye and having only ten per cent vision in the other he is at the controls of WSYR in Syracuse, N. Y., and he is also studying at Syracuse University.

We of VWOA salute *hero* Forrest B. Vosler!

Forrest B. Vosler, winner of the Congressional Medal of Honor, at his post as control operator at WSYR, Syracuse, N. Y.

THE scroll of appreciation awarded by VWOA to each of the co-founders of VWOA will be presented to co-founder Gilson Van der Veer Willets, chairman of our San Francisco chapter at a meeting in San Francisco. The presentation will be made by Arthur A. Isbell, a former VWOA director and recently recipient of the VWOA Marconi Memorial Wireless Pioneer Medal.

The inscription on the scroll reads: "To a pioneer who visualized a fraternal organization of Old-Time Wireless Operators; who translated these early hopes and dreams into practical realization; who gave advice and assistance as to plans and personnel; who offered full devotion to creating and developing the order; who served in major roles during the early and later meetings of the organization; and to whom, in greater part, the association owes its present place in the radio field, the officers of the *Veteran Wireless Operators Association* hereby present this permanent record of appreciation."

Congratulations, GWV.

WE were delighted to hear that the aircraft carrier Hornet returned to the West coast recently, after quite a Pacific theatre battle. For, besides the other five members of the crew aboard, was our own

life member, Lt. Comdr. V. H. C. Eberlin, Air Communications Officer on the staff of Admiral Sample. We should get some real stories from "Ebbie" when they can be told.

Our hearty congratulations to Commodore E. M. Webster on his recent elevation to that rank by President Truman. Commodore Webster is the first communications officer in the Coast Guard. Commodore Webster was more recently Assistant Chief Engineer of the Federal Communications Commission. . . . Glad to welcome George Clark back after a vacation in New Hampshire. He should be in good shape for his usual fine contributions to our 1946 Year Book. . . . Remember, February 16, 1946 at the Hotel Astor, VWOA comes of age. Yes, it will be our twenty-first birthday party and we are mighty proud of the splendid strides we have made in this comparatively short period. With the war in the Pacific now a thing of the past we plan to have a gala *dinner-cruise*.

. . . Our sincerest wishes to life member Haraden Pratt, vice president and chief engineer of All-America Cables and Radio Corporation, and other I.T.T. affiliates, upon his recent election as chairman of the Radio Technical Planning Board. A former professional wireless operator, Mr. Pratt has come up the hard way. . . . We understand that VWOA director, Commander Fred Muller, will be returning to this country, before this issue reaches you. If he does, there's a homecoming party waiting. Welcome home, Commander FM. . . . Hearty congratulations to Dr. Lee de Forest, honorary president of VWOA, who celebrated his seventy-odd birthday during August. We look forward to having *Doc* as a guest of honor at our "coming of age" party in February. Keep it in mind, *Doc*. See you then. . . . Commander G. L. Graveson has recently been overseas on a special communications assignment. . . . VWOA director "Steve" Wallis and Mrs. Wallis recently returned from a vacation on Long Island. . . . Remember we want photos and items for this page. Send them in, we'll do any re-writing necessary.

RESISTIVE ATTENUATORS, PADS AND NETWORKS

An Analysis of Their Applications in Mixer and Fader Systems

[Part Seven of A Series]

by PAUL B. WRIGHT

Communications Research Engineer

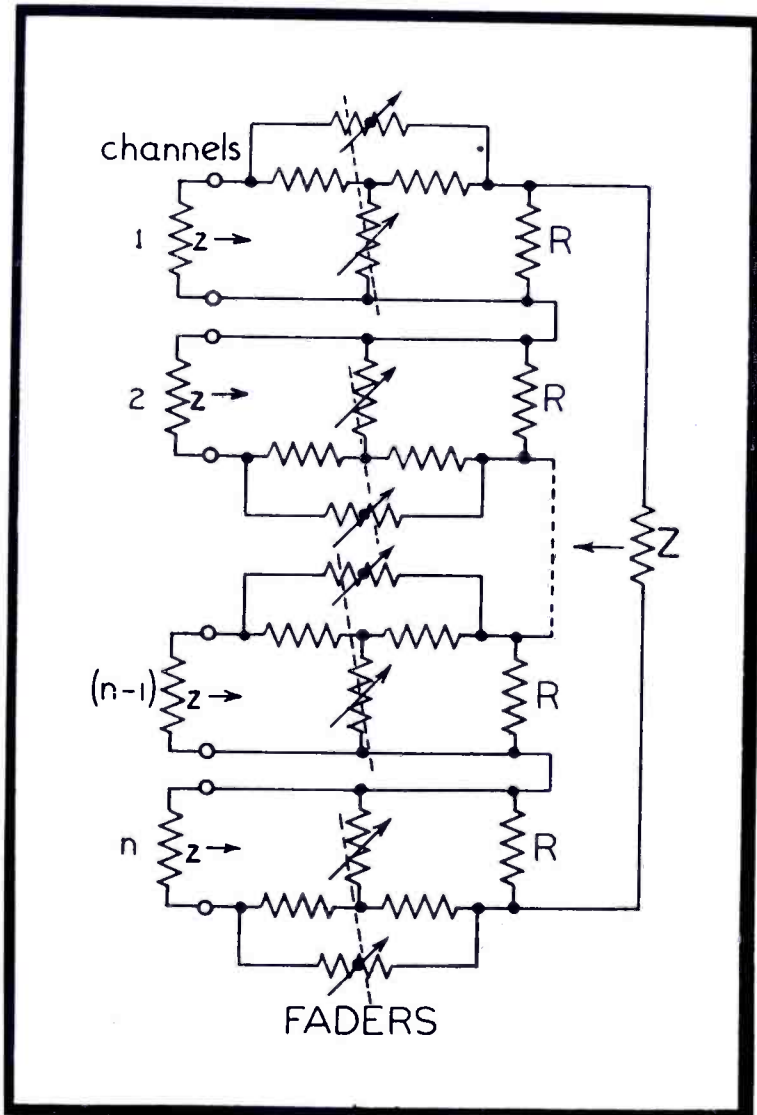

TO avoid reflections of energy which occur at the junctions of two impedances of different magnitudes and to assure complete independence of operation for each channel of a mixer and fader system, it is essential that all impedances be matched to a reasonable degree of precision. The exact degree of mismatch permissible at any junction will

depend upon the amount of loss that happens to be connected into each fader or mixer channel. To avoid the uncertainties of the reactions taking place between channels, with varying degrees of mismatching for a multitude of different loss and impedance combinations, it has become customary and expedient from a practical engineering point of view to specify that the deviations from nominal values of impedance shall not exceed plus or minus some certain percentage of the nominal values. These are determined by the requirements of a particular installation. For a high-

fidelity broadcasting system, the impedance deviations would naturally and of necessity have to be less than those which would be permissible for a common public address system. For the former, resistor values used as components of the mixer and fader networks would normally be specified to an accuracy of $\pm 1\%$ from nominal design requirements, while for the latter system, accuracy limits of $\pm 5\%$ to 20% would be quite satisfactory. Hence, in choosing a fader or mixer for a particular application, careful consideration should be given to the magnitude of distortion and interaction which may be allowed in the fader system and the mixer to which it is connected. This implies that when either building or selecting a mixer or fader network, too much attention need not be paid to obtaining absolute accuracy in elements; for such accuracy increases the time required for adjustment and their consequent final cost. If, for example, a 5% to 10% deviation is permissible in the resistance of the elements to assure given or required limits in impedance or insertion loss, there is little point in striving for 1% or $.1\%$ simply because it is possible to get it with sufficiently applied persistence.

In the preparation of the tables of hyperbolic functions of a real variable the variable requirements for engineering accuracy were anticipated by calculating the tables so that the greatest errors were on the order of a few parts per hundred thousand throughout the majority of the ranges and functions. This order of accuracy

The use of hyperbolic functions for the design and solution of problems involving mixer and fader systems are discussed in this installment. This procedure has been made possible through compression of formulas and their simplification by applying the charts and tables presented earlier in the resistive network papers.

Motorola F-M 3-Way Radiotelephone System PROVES ITS EFFICIENCY

You'll now find 29 State Police Organizations using complete Motorola F-M Radiotelephone Systems. In addition, there are over 500 Counties and municipalities employing Motorola systems to preserve law and order, combat crime and reduce juvenile delinquency. Reasons are efficiency, reliability and simplicity.

MOTOROLA DELIVERS IN ANY TERRAIN

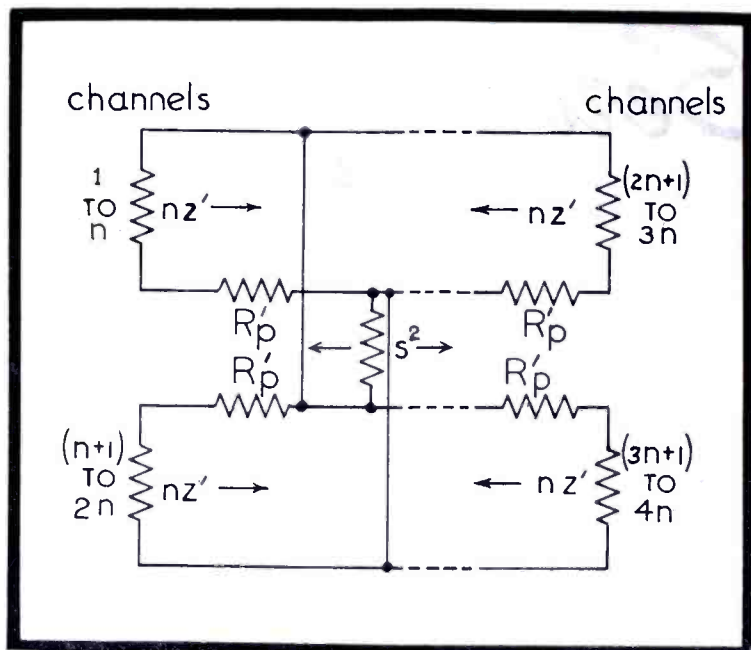

The radiotelephone system best for your community depends on many factors, and every factor should be thoroughly considered. Shore lines, hills and mountains, swamps, deserts, lake country, city skyscrapers and sprawling factory towns, all involve problems that Motorola Radio has successfully solved. Take advantage of Motorola's tested police, fire and railway radiotelephone systems.

Write today for full details to:

GALVIN MFG. CORPORATION · CHICAGO 51

The "Handie Talkie", an exclusive Motorola Radio *first*, is now being used by our fighting forces on every battle front. This portable, battery operated, five and one half pound, two-way radio will be available for police and fire departments when our obligations to the armed forces have been fulfilled.

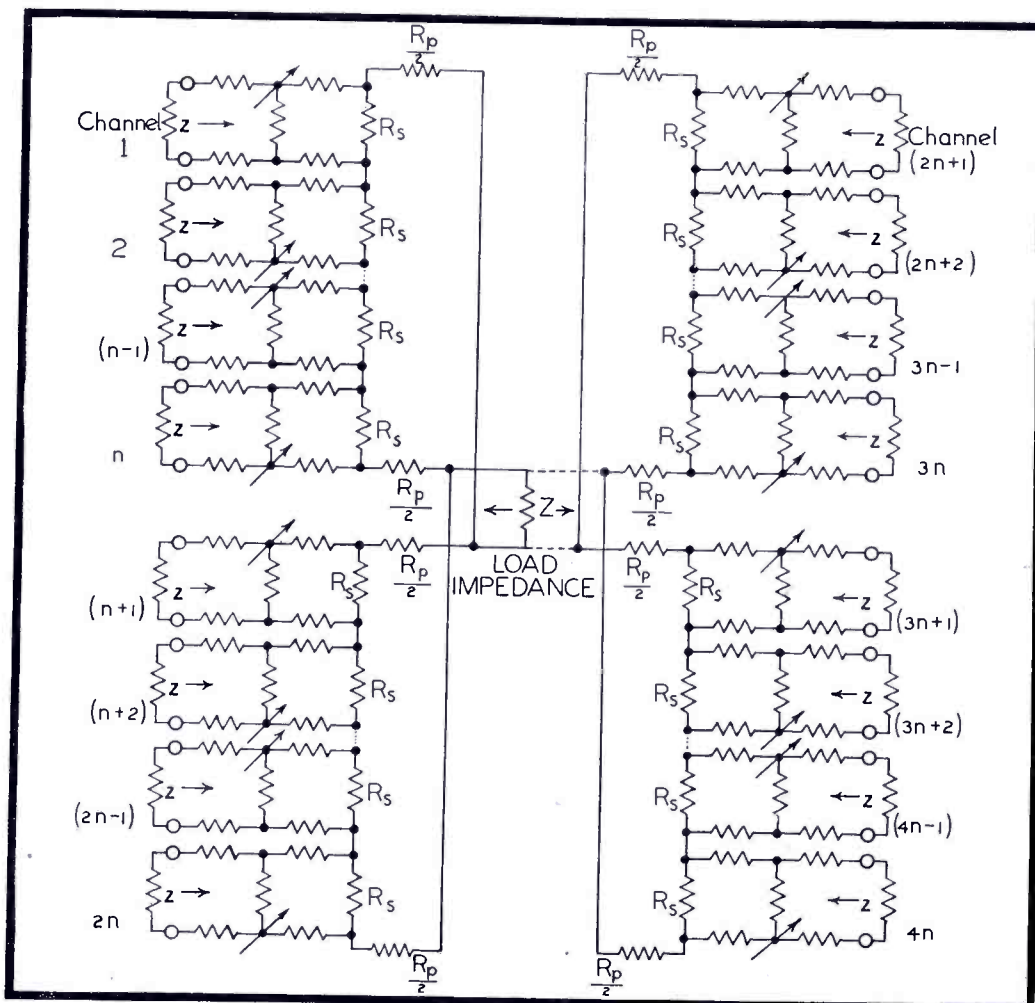

Figures 3 (top, left), 4 (left), 5 (below, left) and 6 (above, right)

Figure 3. A parallel-connected mixer and fader system of n channels with compensating resistances required to maintain a match of impedances at all junctions of the network system. Figure 4. The equivalent of Figure 3 on a unit channel basis with faders removed. $R' = R/z$. Figure 5. A series-parallel system of mixer and faders with the necessary compensating shunt and series resistances required to match all impedances at their respective junctions. Figure 6. One stage in the reduction of Figure 5 to an equivalent unit basis with faders removed.

$$z' = R's / (R's + 1)$$

was adhered to to permit the highest degree of precision possible in the design of quality equipment. For equipment not requiring this degree of accuracy, the tabulated figures may be rounded off as desired. For example, if slide rule accuracy is desired, three significant figures are sufficient for a ten-inch rule and three or four for a twenty-inch rule, depending, of course, upon the sections of the scales being used. If higher order accuracy is necessary, arithmetic, logarithms or a calculating machine may be used as desired by the calculator.

In the straightforward design of mixers and faders, the input-to-output network impedance ratios obtained for many designs will frequently be found to be of inconvenient values that cannot be realized readily by the common impedances of connecting equipment normally available from commercial companies, without special and expensive design. To circumvent this difficulty, a simple and inexpensive expedient frequently resorted to is to use matching or building-out methods, or both, if necessary. The building-out methods usually consist of adding resistance either in series or shunt as needed to either build up the terminating impedance to match the network-image impedance, or to step down the network image impedance to match the terminating-network impedance. The additional insertion losses and the element values required for the system may be calculated by using Figures 1 to 4 of the charts given in Part II'. Matching methods require the use of a dissymmetrical network, usually of the minimum loss type. This will generally be a network of the L taper (case III type).¹ The losses and ele-

WHAT ARE YOUR TRANSFORMER PROBLEMS?

IS IT QUANTITY?

UTC, the largest supplier of transformers to the electronic industry, is in a strong position to meet your requirements for postwar applications — radio, communications, FM, Television, electro-medical, etc.

IS IT QUALITY?

UTC, in the collective opinion of critical users, is the "leader in the field" for units of lasting dependability. Incidentally, our Varick Street Plant is now running 98% hermetic sealing components.

IS IT DESIGN?

UTC, known for pioneering efforts, manufactures a range of designs from the smallest transformers in the world to 50,000 ampere current transformers and complex filters.

IS IT PRICE?

UTC, because of ingenious production methods, can give you a reliable product at a competitive price . . . war or postwar. And we can deliver now.

RESISTIVE NETWORKS

(Continued from page 66)

ferent types of systems are shown by Figures 1 to 7 as well as the equivalent circuits on an individual channel basis using normalized network configurations. These are configurations which are placed upon a unit basis referred to z , the smaller of the terminating impedances. The larger of the terminations is referred to with the upper case letter, Z . For example, to match mixer and fader network impedances which are series connected, it is necessary to place a shunt resistor across each fader output, while for a parallel system, it is necessary to build out each fader output with a series resistor so that each fader and mixer unit will be properly terminated. The series-parallel and the parallel-series systems use combinations of both series and shunt resistors to match the impedances of the connected units. The series-parallel system will utilize shunt resistors for the series-connected faders, and series resistors for the paralleled groups of series connected faders. The parallel-series system will have series resistors for the parallel connected faders, and shunt resistors for the series-connected groups of parallel connected faders.

Other Mixer and Fader Networks

Other types of mixers which are particularly useful for many applications, but are not as well known as the types mentioned above are of the multiple bridge, and the lattice type configurations respectively.^{2, 3, 4}

As most commonly used, mixer and fader systems are connected so that a fader network is placed in each channel to control the level of the signal from that input, while the mixer proper is generally termed a master mixer and is connected on its input side by the combined outputs of all faders, and on its output side by a load such as a line or amplifier.

Series-Parallel Mixer and Fader Systems

For these mixers it is convenient to make direct usage of the previously developed theory and tables prepared for the series and the parallel mixer and fader systems. To be as practicable as possible with the least loss in generality of treatment, these systems will be assumed to be arranged as per Figure 5. This Figure shows n fader channels connected in series per group

and m groups connected in parallel. The series-connected faders each have a shunt compensating resistor and the parallel-connected groups of series-connected faders each have a series compensating resistor. The complete set of series-parallel-connected faders are then connected to the master mixer control network. By means of the master mixer unit, the signal or program level of all faders may be simultaneously regulated. Individual faders are used to regulate the level of the signal or program material being fed to the master mixer from each channel of the system. Although, basically, this network is no more complex than those of simpler configuration, some assistance in visualizing the performance of a single channel is gained by making the unit equivalence representation in two steps as shown by Figures 6 and 7, instead of in one step as was done for the simpler configurations.

Since, in general, the number of fader networks connected in series will not be equal to the number of each groups connected in parallel, the adoption of suitable subscripts to the elements and terminating impedances is essential for analysis purposes. For series-connected mixers in a group, the lower case letter s will be used, and for parallel-connected groups of such mixers, the lower case letter p will be used. These will bear no relationship whatever to the letters used in the symbolical notation adopted throughout this series of papers on purely resistive networks.

The networks comprising the faders are of one of the standard types. These are the T , π , bridged- T or ladder configurations. The master mixer is usually one of the T or the π type networks. The Figures which show the equivalent channel representation on a unit basis in all cases have the fader networks removed or turned to the zero insertion loss position. If, for example, faders are used which do not have zero insertion loss, such as the ladder networks discussed in Part V,⁶ it will be necessary to add this insertion loss to that of the individual channel loss as found assuming the fader network to be removed from the circuit.

The equations which govern the design of the elements of the various types of mixer and fader system networks are given by the analytical development from the straightforward electric circuit theory considerations which follow. The algebraic forms are interchangeable with those of the hyperbolic functions by means of suitable transformations. The inser-

tion losses are shown to be functions of the image-impedance ratios of the networks and these, in turn, are by analogy with *L*-taper networks of case III further shown to be functions of the number of channels of which the system under consideration is composed.

Series Mixer and Fader Systems

The method of connecting faders and their associated mixer, generally known as a master mixer, is shown for a series-connected system, in Figure 1. In Figure 2 we have the equivalent network represented on a unit basis for any single channel. For this Figure, the fader networks are removed from the circuit for purposes of analysis, since each of the channels are assumed to feed into the network at the network image impedance level. Further, the master mixer may also be removed since it is assumed to operate between its image impedances. The only effect of the reinsertion of these networks into the equivalent circuit configuration is to add either an insertion loss or a variable loss dependent upon the setting of the inserted networks. The total loss is then the sum of the component losses taken algebraically. The losses are expressed in terms of decibels below some arbitrary zero reference. The references most commonly used are those of either 1 milliwatt dissipated by 600 ohms, or 6 milliwatts dissipated by 500 ohms. The difference in level between these two references at their zero indications, as read by volume indicators, is 7.78 db.

Referring to Figure 2, the image impedances on a unit basis are

$$1 = \frac{R' \left(s^2 + (n-1) \frac{R'}{R'+1} \right)}{R' + s^2 + (n-1) \frac{R'}{R'+1}} \quad (1)$$

and

$$s^2 = nR' / (R' + 1) \quad (2)$$

where: $s^2 = Z/z \geq 1$, the ratio of normal mixer image impedance to that of the source or input image impedances of the series system; $R' = R/z$, the unit shunt compensating resistance; and $n =$ the number of channels which are to be connected in series in the complete system.

If equation 2 is used in equation 1 first to eliminate s^2 , and then to elim-

$$Z/z = n/(n-1) \quad (3)$$

for the shunt resistance to add across each fader network, and

$$Z/z = n^2/(2n-1) \quad (4)$$

for the ratio of the image impedances of the system.

By observation of equation 3 and 4 of this equivalent unit network and that of the L-taper network shown as case III in Figure 12 of Part III, the equations relating the hyperbolic functions and the number of channels of the series system may be written by inspection as

$$Z/z = n/(n-1) = as = s \operatorname{csch} \theta \quad (5)$$

and

$$Z/z = n^2/(2n-1) = E = \cosh^2 \theta \quad (6)$$

From 6, $s = \cosh \theta$. Hence, 5 may be written in the alternative form of

$$\begin{aligned} Z/z &= s \operatorname{csch} \theta = \cosh \theta \operatorname{csch} \theta \\ &= \cosh \theta / \sinh \theta = \coth \theta = c \quad (7) \end{aligned}$$

In these equations, $\theta = \cosh^{-1} s = 1.15129 \times \text{No. (db) insertion loss of the network}$. The symbolical forms used throughout this part and the remainder of the paper are defined completely by the key sheet presented in Part IV⁶.

One additional form of equation relating to the shunt-compensating resistance, in terms of the image impedance terminations ratio and the number of channels of the network system, is given by dividing equation 5 by 6, term by term, and solving for Z/z. This equation is

$$Z/z = s^2(2n-1)/(n(n-1)) \quad (8)$$

To place all terminations and elements of the network system upon a common impedance basis, it is only necessary to multiply each side of the equations above by z, the smaller of the two terminating impedances.

Insertion Loss of a Series-Connected Mixer System

The insertion loss of a series mixer system may conveniently be found from the equation given in Figure 12 of the chart in Part II and by use of equations 5 and 6 of this paper. The equation supplied is in terms of transmission loss, but this is identical with the insertion loss in this case since it is a minimum loss network. Therefore the loss of each channel taken on either an insertion or a power transmission loss basis is given by

$$L_b = 20 \operatorname{Log}_{10} (s + \sqrt{s^2 - 1}) \quad (9)$$

which becomes by use of equations 5

and δ ,

$$db = 20 \text{ Log}_{10} \left(\frac{n}{(2n-1)^{1/2}} + \sqrt{\frac{n^2}{2n-1} - 1} \right) \quad (10)$$

$$= 20 \text{ Log}_{10} (2n-1)^{1/2} \quad (11)$$

$$= 10 \text{ Log}_{10} (2n-1) = 10 \text{ Log}_{10} k^2 \quad (12)$$

where: k^2 is defined as equal to the power ratio taken equal to or greater than unity.

From 12,

$$k^2 = 2n-1 \quad (13a)$$

or

$$k = (2n-1)^{1/2} \quad (13b)$$

from which,

$$n = (k^2 + 1)/2 \quad (14)$$

By definition, $k = \epsilon^\theta$, and therefore equation 14 may be written in the form

$$n = (\epsilon^{2\theta} + 1)/2 \quad (15)$$

This form substituted into any of the formulas given in terms of n will give the exponential forms, from which, by definition, the hyperbolic forms may be written as given above.

Parallel Mixer and Fader Systems

The method used for connecting parallel faders and their associated master mixer control network is shown by Figure 3. In this system, the compensating resistance is used to build out each fader channel so that no mismatching of impedances will occur at any junction of the network system. The equivalent network representation of the parallel-connected system is shown, on a unit basis for any single channel, by Figure 4. In this Figure, as in that for the single channel of the series system, the fader networks have been removed from the system for purposes of simplifying the analytical expressions for the parameters of the system. The remarks regarding the effect of the reinsertion of the series faders into the network upon the losses of the system taken upon an overall basis are equally applicable here and also for all other types of faders and mixer systems discussed in this paper.

By making use of Figure 12, Part II, it may be observed that the equations for the L taper, case III network element values shown in that chart, are reciprocal to each other in

ns of the hyperbolic portions of the ations. By comparing Figure 4 this paper with that figure, the ations for element values and the o of the terminating image im- ances may be written directly in ns of the hyperbolic functions. rther, these in turn may be written terms of the number of channels m the equations derived for the es-connected system. This pro- ure enables us to write, for the t compensating resistance to use in ies with each fader, the equation

$$= s^2 (n-1)/n = As = s \sinh \theta \quad (16)$$

$$Z/z = n^2/(2n-1) = E = \cosh^2 \theta \quad (17a)$$

$$B = \cosh \theta \quad (17b)$$

erefore 16 becomes

$$= s^2 (n-1)/n = \sinh \theta \cosh \theta \\ = \frac{1}{2} \sinh 2\theta = \frac{1}{2} G \quad (18)$$

ubstituting equation 17a into 16, the mpensating resistance may be writ- directly as a function of the num- of channels only, thus

$$\frac{n(n-1)}{2n-1} = \frac{1}{2} \sinh 2\theta \\ = s^2 \tanh \theta = Cs^2 \quad (19)$$

By multiplying each side of equa- ns 16 to 19 by z , the smaller of the minating impedances, the para- ters of the network will then be ex- essed on a full instead of a unit im- dandance or normalized basis.

ertion Loss of a Parallel- onnected Mixer System

Since the equivalent circuit of the stem shown in Figure 4 is exactly e same as that of the series type stem shown in Figure 2 as far as b form is concerned, and also since is an L -taper network of case III, th both ends terminated in its age impedances, the loss equations e the series system given by equa- ns 9 to 15 apply directly for the rallel system also. The significant fference is one merely of designation. e designation of the impedance ratio e the series cases applied to the ratio oad to source impedances, while in e parallel case, the impedance ratio plies to the ratio of any one of the urce impedances to the load im- dandance. Therefore, with this dif- fference in designation only, all of the s equations for parallel-connected ixers and faders are identical in ery respect to those derived for the ries-connected faders and mixers, d hence it will be unnecessary to epeat them here.

ries-Parallel Mixer and Fader Systems

For these mixers it is convenient to

HERMETICALLY SEALED

HERMETICALLY SEALED Advance Relays maintain their original efficiency under conditions that soon ruin or dangerously impair other types of relays. Dust, moisture, oil or fungus can't reach the precisely adjusted parts. The low atmospheric pressure of high altitudes can't cause failure through arcing or condensation. That these relays are tamper-proof is another advantage. And basically, like all Advance Relays, they have the stamina to resist the severe shock and vibration of battle, as has been so abundantly proved on all war fronts.

TYPE H-1600

Double pole, single throw. (May be had in single pole, double throw.) Full-floating armature suspension minimizes friction between frame and armature. Pure silver contacts are standard, with palladium or platinum alloys on special order. Wiping contacts insure clean contact surfaces. All steel parts cadmium plated to withstand the 200-hour Salt Spray Test. All brass and bronze parts nickel plated. All laminated phenolic parts moisture-and-fungus-proofed. Coil is wound with highest grade enamel wire and insulated with 100% cellulose acetate with a final vacuum varnish impregnation. Dimensions are: height of case only, 2"; diameter 1-5/8". Mounting screws and solder lug terminals project 5/16" below case.

Any Advance Relay can be furnished in hermetically sealed containers on special order. When you select Advance, you will have relays exactly as you want them. Our engineers are at your service. Write today for full information.

make direct usage of the previously developed theory and tables prepared for the series and the parallel mixer and fader systems. To be as practicable as possible with the least loss in generality of treatment, these systems will be assumed to be arranged as per Figure 5. This Figure shows n fader channels connected in series per group and m groups connected in parallel. The series-connected faders each have a shunt compensating resistor and the parallel-connected groups of series-connected faders each have a series compensating resistor. The complete set of series-parallel-connected faders are then connected to the master mixer control network. By means of the master mixer unit, the signal or program level of all faders may be simultaneously regulated. Individual faders are used to regulate the level of the signal or program material being fed into the master mixer from each channel of the system. Although, basically, this network is no more complex than those of simpler configuration, some assistance in visualizing the performance of a single channel is gained by making the unit equivalence representation in two steps as shown by Figures 6 and 7, instead of in one step as was done for the simpler configurations.

Since, in general, the number of fader networks connected in series will not be equal to the number of such groups connected in parallel, the adoption of suitable subscripts to the elements and terminating impedances is essential for analysis purposes. For series-connected mixers in a group, the lower case letter s will be used, and for parallel-connected groups of such mixers, the lower case letter p will be used. These will bear no relationship whatever to the letters used in the symbolic notation adopted throughout this series of papers on purely resistive networks.

Let us consider n_s sources of program material originating in or from lines, loops, turntables, microphones or amplifiers connected in series and n_p such groups connected in parallel. The normal series mixer system output image impedance becomes the new parallel-mixer system input image impedance. Figure 7 shows a single channel on a unit basis. The input image impedance of each fader channel is z_s ohms and the output image impedance of the m -paralleled groups of series mixers is z_p . The output image impedance of each series-connected fader system is Z_s ohms and the input image impedance of each

Because Accuracy Hangs in the Balance

**... Simpson balance weights
are LOCKED IN PLACE**

PERHAPS it's the smaller details, like these balance weights, that best illustrate the value of Simpson's 35 years of experience.

Though only tiny coils of wire, these balance weights have an important function—to offset the weight of the pointer so the moving assembly will swing in perfect balance. If the instrument is to stay accurate, they must stay in place.

So Simpson has devised a method of locking these balance weights in position. This construction not only defeats vibration and shock, it per-

mits even greater initial accuracy and makes possible faster, more efficient production.

Such refinements come from a greater knowledge of the problems of instrument manufacture, and a greater fund of practical experience which can be applied to their solution. This is the simple reason Simpson Instruments are writing such an outstanding service record in posts of vital responsibility. This, too, is your guarantee of the ablest translation of today's advances in tomorrow's instruments.

RESISTIVE NETWORKS

(Continued from page 74)

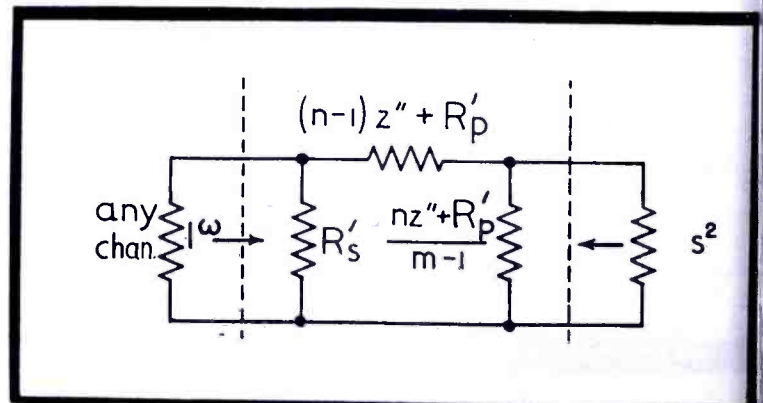

parallel group of series-connected system is Z_p . But, to have a proper impedance match at their junctions, these must be equal to each other. Hence, $Z_s = Z_p = Z$.

The equations of the series and the paralleled groups may, with their associated subscripts, be written directly from the derivations which were derived for the series and for the parallel mixer and fader systems.

For the series-connected fader sys-

Figure 7

Final stage of the reduction of Figure 5 to an equivalent unit channel basis. $z'' = R'_s/(R'_s + 1)$ = z' and $R'_s = R_s/z$.

(Continued from page 37)

- $k = 2\pi/\lambda$
- $\lambda = \text{wavelength}$
- $K_1 = \text{Bessel Function of the first order}$
- $R' = \text{radius of opening}$

A series which may be substituted for the factor $K_1(2kR')$ is⁶

$$(2kR') = \frac{2}{\pi} \left[\frac{(2kR')^3}{3} - \frac{(2kR')^5}{3^2 \cdot 5} + \frac{(2kR')^7}{3^2 \cdot 5^2 \cdot 7} - \dots \right] \quad (4)$$

If f remains less than 150 cps and l is less than 25 cm, the second and third terms of this series may be neglected with sufficient accuracy and equation 3 will reduce to

$$X_{ev} = \frac{3.4 f \rho}{R'} + \frac{2 f l \rho}{(R')^2} \quad (5)$$

Equation 5 is derived for a circular opening of radius R' . In practice the release opening will consist of an opening of any shape of which only the total area is fixed, so that

$$r = [S(R+r)]^{1/2} \quad (6)$$

where r is the radius of a circular opening possessing an area equal to that required for the release opening.

Equating X_{ev} and X_{Lo} and substituting for R' , an expression for V_e is obtained

$$V_e = \frac{c^2 S (R+r)}{4\pi f^2 [l + 1.7 [S (R+r)]^{1/2}]} \quad (7)$$

Using 1185 feet-per-second as the velocity of sound, equation 7 reduces to

$$V_e = \frac{9.47 \times 10^6 S (R+r)}{f^2 (.588l + [S (R+r)]^{1/2})} \text{ cu. in.} \quad (8)$$

- Where: $V_e =$ initial enclosure (volume, cubic inches)
- $f =$ loudspeaker resonant frequency, cps
- $l =$ release opening length, inches
- S, R and $r =$ loudspeaker dimensions, inches

As can be seen, a reduction in the required enclosure volume for any given set of conditions may be effected by increasing the length of the release opening, l ; e.g., by extending

PEAK PERFORMANCE

on the "Highs"

with the new
RME 45

Features

- Streamlined two-tone cabinet
- Acoustically designed speaker housing
- Relay rack mounting panel
- Six bands, 550 to 33,000 KC
- Automatic noise limiter
- Relay control and break-in terminals
- Signal level meter
- Variable crystal filter
- Bandspread—equivalent to 75 linear inches for every 180 degree sweep of main pointer
- Now Sold On Priority To essential services

★
With the new RME 45 you'll have peak performance on the high as well as the low frequencies. There's no secret about how it was done—even though some of the experience has been gained while producing for the Armed Forces.

★
It was accomplished by the use of loctal tubes . . . shorter leads . . . reduced distributed capacity . . . temperature compensating padders . . . and a score of additional refinements—each making its individual contribution to increased efficiency.

★
The RME 45 combines careful workmanship with ease of operation, sound engineering and brilliant performance.

RESONANT SPEAKER ENCLOSURES

(Continued from page 77)

it within the enclosure as shown in Figure 5. An estimation of the reduction possible in this manner can be gained from Figure 8 which indicates the volume ratio existing between enclosures possessing varying release opening lengths as compared to one having a length considerably less than 0.1".

It must be remembered that both the loudspeaker and the release opening if extended inward, will displace a volume which must be added to V_c . This will provide the final volume, V_t , from

which the enclosure dimensions are evaluated. Figure 3 also indicates roughly the volumes displaced by loudspeakers of various diameters and may be used as a guide.

The dimensions of an enclosure of a given volume will depend on which ratios of height and width, to depth have the most satisfactory appearance. The volume of the enclosure, V_t , in Figure 6 is xyz , and since the dimensions y and z , the height and width, are some multiple of the smallest dimension x , the depth, then

$$ax = y; \quad Bx = z$$

and

$$x, \text{ the depth} = \left[\frac{V_t}{ab} \right]^{1/3}$$

Typical values for this type of enclosure are $a = 1.85$ and $b = 2.45$.

Design Procedure

Figures 7 and 8 will facilitate design calculations. The procedure for their use is as follows:

(a)—Determine the loudspeaker dimensions S , R , and r and the loudspeaker resonant frequency, (f)

(b)—Calculate $S(R + r)$.

(c)—Using Figure 7, determine the initial volume V_c , from the values obtained in a and b . For convenience these curves assume negligible values of (l).

(d)—Select a release opening length (l), and find the corresponding reduction factor (n) in Figure 8 for the particular value of $S(R + r)$ used.

(e)—Multiply V_c by this reduction factor and add to it V_a , the volume displaced by the loudspeaker and other material to be mounted within the enclosure. The final volume, V_t , is this sum or

$$V_t = n V_c + V_a \quad (1)$$

(f)—Choose suitable height and width to depth ratios (a and b) and calculate V_t/ab . Use Figure 9, curve A , to determine the smallest internal dimension x , (the width). If V_t/ab is less than 1000 cu. in. use curve B , dividing the horizontal scale by 100 and the vertical scale by 10. The remaining internal dimensions, the height and width, are then obtained from equation 7.

In actual construction, the required volume may be approximated, and the enclosure exactly tuned by varying the release opening area or length slightly, whichever is practicable. Mechanical resonance of the cabinet members can be avoided by using material of low elasticity while placement of sound absorbant on the inner walls of the enclosure particularly opposite the loudspeaker will help prevent hangover or echo effects.

Care must be taken in the installation of amplifying equipment within the same enclosure as the loudspeaker to prevent acoustical or mechanical feedback. To check on the quality of construction, a frequency run at the highest output level anticipated should be made and any sympathetic vibration observed should be damped out with further reinforcement.

ELECTRONIC COUNTER

(Continued from page 46)

al form of the voltage equation after the n -th cycle may therefore be deduced and written as

$$= E_M [1 - (1-r)^n] \quad (11)$$

This gives the voltage across C_2 after n cycles have been completed.

One method of justifying the logic equation 11 without a rigorous proof is to consider the result after an extremely large number of cycles has passed. Since r is less than one, the value of $(1-r)^n$ will approach zero as n approaches infinity. Therefore, the voltage across C_2 approaches the value of E_M . That the voltage across C_2 will continue to increase with each cycle of the applied signal but it may never exceed the peak value of the applied voltage, and theoretically would require infinite time to become equal to the peak value of the applied voltage. For practical purposes, the voltage across C_2 may be regarded as reaching the peak value of the applied voltage in a finite time. The time required will depend on the frequency of the applied signal and the relative capacities of the condensers C_1 and C_2 .

The practical application of this circuit lies in its ability to function as a counter of pulses, or as a frequency divider. Figure 4 illustrates the manner in which this takes place.

The frequency of the output pulses will be seen to be some fraction of the frequency of the input pulses. The circuit has therefore *counted* the number of input pulses by indicating one output pulse for a specific number of input pulses.

Further analysis of the grid voltage of the triode tube, V_g , with respect to the cathode is necessary for complete understanding of the counting circuit's operation. The grid voltage (E_g) of V_g will be increasing by steps in accordance with equation 11 just as the voltage across C_2 increases. Eventually (unless V_g is biased further below cut-off than E_M , in which case the circuit becomes inoperative), E_g rises to the point where V_g is able to pass current. The portion of the circuit involving this triode now functions as a blocking oscillator which has just been triggered. Upon being triggered, the plate voltage (E_p) drops sharply, and the grid voltage rises sharply as shown in Figure 4. It will be noted that E_g rises well above the level it would have reached if another step in voltage had taken place. As a matter of fact, it is this condition which makes a blocking oscillator so appropriate for use as the final stage of the counter circuit. The grid voltage of

ELECTRONIC COUNTER

(Continued from page 79)

V_3 is driven quite positive with respect to the cathode so that grid current flows and provides a discharge path for condenser C_2 . Meanwhile condenser C_3 keeps the cathode potential of V_3 from rising rapidly when the tube begins its heavy conduction. This, too, is a necessary feature to the operation of the circuit. For, if the cathode potential is allowed to rise when E_x rises, the grid may never go positive with respect to the cathode, in which case C_2 will not be able to discharge. Discharging of C_2 is necessary if the counter circuit is to count the same number of pulses each time. Any charge still on C_2 will act to decrease the bias on V_3 and decrease the number of pulses it will pass before being triggered again.

The setting of potentiometer P_1 determines how many pulses the circuit will count. In the case illustrated in Figure 4 the circuit is counting by fours. Should the bias on V_3 be increased to an amount slightly below the voltage resulting from a substitution of five for n in equation 11, the circuit will then be counting by fives and the pulse recurrence frequency may then be said to have been divided by five.

It is recommended that this counting circuit not be used to count many more than ten pulses. Operation may become quite unstable when counting by too high a number is attempted. This is because each succeeding *step* in voltage is smaller than the preceding step. The amplitude of each step in voltage, since it is the difference between the voltages for two successive intervals of time, may be expressed as

$$S_n = E_n - E_{n-1} = E_M [1 - (1-r)^n] - E_M [1 - (1-r)^{n-1}] \\ = E_M [(1-r)^{n-1} - (1-r)^n]$$

$$\text{OR } S_n = r E_M (1-r)^{n-1} \quad (12)$$

Since $(1-r)^{n-1}$ decreases as n increases, the size of the step decreases as an attempt is made to increase the number of pulses the circuit can count. When the difference in voltage becomes too small, any irregularities (such as a change in supply voltage) will change the counting of the circuit and cause its operation to be unstable. To allow the operation of the circuit to be as nearly stable as possible, the circuit components must be chosen with care, particularly condensers C_1 and C_2 . The actual capacity of these condensers will depend upon the duration of the applied pulse. The narrower the pulse, the smaller must be the condensers. The relative capacity of the condens-

(Continued on page 81)

It's a
GREENOHM!

Standard 10 and 20 watt fixed resistors, 1-50,000 and 1-100,000 ohms. Also standard adjustable resistors, 25 to 200 watts, 1-100,000 ohms, with sliders and brackets.

★ And that means a lot. Those green-colored inorganic-cement-coated Clarostat power resistors are now found in radio-electronic assemblies that are built to last. These resistors positively "stay put". They are brutes for punishment. Their service records are outstanding. Yes, use Greenohms for better initial equipment or for better maintenance jobs.

★ Ask our local jobber about standard Greenohms. And for special applications, write us direct.

CLAROSTAT MFG. CO., Inc. · 285-7 N. 6th St., Brooklyn, N. Y.

Who is a major supplier of critical radio and electronic equipment to industry, war agencies, service men, schools, etc.?

HARVEY!

Who can locate hard-to-find parts, or recommend effective substitutes, for the harassed purchasing agent?

HARVEY!

Who has up-to-the-minute information on latest developments in the field for present or postwar use?

HARVEY!

Who takes every possible means to deliver the goods promptly, to give you extra-special service without extra cost?

HARVEY!

HARVEY has been in the business for a dozen and a half years. We stock lines of leading radio and electronic manufacturers. And we back them up with our own specialized experiences which, in turn, can save you time, trouble and money.

AACS MAINTENANCE

(Continued from page 81)

gaze took in the little Collins 40-watt rig carried as cargo. Whelan had hooked it to the emergency dynamotor in the plane, tied forty feet of twisted pair (telephone line) to the Collins for an antenna, used a parking rod as a ground, and the mike from the pilot's compartment.

"Got 'em the first time, too," he stated proudly. Frizen just grinned. Give a radio mechanic a tube and a few parts and he'll talk to Mars on it . . . thank God for that!

The AACS man's job is not always just repair. In the states and in rear-echelon units the main installation is put in and tested by AAF and Signal Corps engineers. However, when air communications were being rushed into operation along the north and south Atlantic routes to Europe, the AACS man did his share of installation. At that time there just weren't enough AAF and Signal Corps engineers to cover every job. The high priority given the work coupled with the time element permitted no waiting. Everyone had a job to do. Radio operators, typists, supply men, all worked under the supervision of the maintenance man. They put up a temporary station, but it worked. The engineers came along later and put in the permanent station.

In battle areas AACS moved in with combat troops on every invasion. Tactical teams assembled in a few hours the contact link so vital in the rapid expansion of Allied ground and air power. Radio range and homing beacon stations, air/ground installations, and control towers were placed along aerial warfronts.

The control tower on Saipan brought the first B-29s in from a Tokyo raid at the rate of one every 20 seconds . . . order out of chaos. The one installed at Tacloban airstrip on Leyte last Fall enabled over two hundred Naval planes, deprived of their carrier by Jap bombs, to land, refuel, and take off to fight again. Total time elapsed . . . 24 hours. Direction-finding stations, in the treacherous Hump area have saved countless planes and tons of cargo by giving the lost pilot his position and a safe route to fly. With the aid of air communications cargo planes have flown plasma into battle areas. On the return trip they haul the more seriously wounded to hospitals. Instrument-landing systems keep vital traffic moving in and out of airfields

ELECTROX Low-Capacity RECTIFIERS

Full-wave and half-wave copper-oxide rectifiers for instruments, test-sets and similar applications. Supplied, since 1930, to leading manufacturers.

ENGINEERS NEEDED

Opportunities for advancement are greater with a reputable company that is continually growing and expanding.

We need qualified engineers for permanent positions:

1. In our Radio Division, to carry on research and development of Receivers, Transmitters, Direction Finders, F-M Equipment, Broadcast and Television Receivers, and specialized Aircraft and Marine Equipment.
2. To interpret and prepare Specifications, Instruction Books and Engineering Estimates.
3. In our Railway Signal Division, to develop and install Carrier Current Equipment.

Write for application form, and state condition of availability.

 INSTRUMENTS, INC.**
 CLEARFIELD, PA.

Even though the weather is zero-zero. The necessity of air communications has been proved in the cauldron war. That's why joint air communications operated by AACS for the Army, Navy, and Marine pilots had been established in the Pacific. PACSPAC has proved its value in coordinated air operations. That's why maintenance men sat shoulder to shoulder with Marines, Seabees, AAF weathermen, and Joe Infantry in every landing barge invasion. That's why these radio operators, control tower men, clerks and radio mechanics knew the whine of a Jap sniper's bullet, and the whistling scream of shells. They kept the circuits . . . on the air!

RADIO/TELEVISION OSCILLATORS

(Continued from page 54)

Frequency of oscillation of a vacuum tube tuned-circuit oscillating system usually includes L, C, R the resistance L, R_p , the plate resistance of the tube, and an element relating to the coupling coefficient whether it be inductive or capacitive coupling. The L and C include the distributed capacities and inductances of the leads and tube elements.

Variations in any of these parameters will result in variations in frequency, whether these variations are rapid or slow. For home receivers the most important sources of instability are voltage variations, temperature variations, humidity changes and age with its attendant dust, dehydration, corrosion, etc. In applications where there is a great deal of vibration, such as in portable mobile use, we have another instability factor, mechanical agitation and vibration of the component parts of the oscillating circuit. With self-excited oscillators a tube replacement may displace the resonant frequency of the oscillating circuit because of slightly different characteristics from the replaced tube. This frequency change may be so great at v-h-f that the receiver will no longer track properly and a loss in gain or sensitivity results.

Voltage variations will cause R_p to vary, as well as variations in R_L resulting from the reflection back into the resonant circuit of load variations due to the voltage changes.

Temperature changes cause most of the drift, especially in a v-h-f receiver during the first few minutes of warming up. Coils expand slightly as the temperature increases and therefore L varies. The dielectric

constant of capacitors varies with temperature; dielectric dimensions also vary with temperature changes. Tube capacities change with temperature changes, and these capacities often are in shunt or in series with the lumped LC circuits.

Attempts have been made to compensate for these temperature changes by the utilization of negative temperature capacitances in circuits where the average t-c of the capacitance is positive.

High-Q circuits help minimize the effects of voltage variations and load variations on the oscillator. At v-h-f resonant lines begin to approach the realm of reasonableness insofar as physical size is concerned. But even at 100 mc a $\frac{1}{4}$ -wave resonant line would be about 9" to 10" long. Tuning a resonant line tank circuit would be a fairly complicated mechanical problem in a home receiver.

In magnetically-coupled feedback oscillators the coefficient of coupling is made very high to achieve maximum flux linkages and to eliminate stray fields with attendant phase shifts.

Llewellyn has demonstrated how, with suitable reactances in the grid and plate circuits of oscillators, it is possible to compensate quite well to eliminate frequency changes with voltage variations. But in the ordinary home receiver these may be fairly complicated additions because stability improvements generally are effective at only one frequency.

Electron-coupled oscillators and m-o-p-a systems may be utilized to improve stability, especially at v-h-f where the fundamental oscillator frequency may be made fairly low and the oscillator tube may be operated at reduced voltages in combination with a frequency multiplying amplifier.

The piezoelectric quartz crystal, perhaps the best stabilizing medium for an oscillator, has many advantages over lumped LC circuits. There are also disadvantages in specific amplifications.

The crystal is a very high Q mechanical oscillator or resonator. (Crystalline quartz is one of the most elastic bodies known, with an extremely low mechanical damping factor.)

As the crystal plate vibrates, charges are developed across two opposite faces and these charges are varied at the same rate that the crystal vibrates and compresses and decompresses. If these charges are

JONES 400 SERIES PLUGS and SOCKET

P-406-CCT

S-406-AB

A medium size Plug and Socket that fulfills practically every requirement in the public address radio and kindred fields. Socket contacts are phosphor bronze cadmium plated.

Plug contacts are of hard brass, silver plated. Insulation is of molded Bakelite. Plugs and Sockets are Polo

ized. Made in 2, 4, 6, 8, 10 and 12 contact Caps are of steel with baked black crackle enamel. A quality item at popular price. Send today for catalog No. 14 listing complete line of Jones Electrical Connecting Devices—Plugs, Sockets and Terminal Strip

CARTER, a well known name in radio for over 20 years

zed and amplified the simple harmonic motion of the vibrating quartz plate is translated into a simple periodic variation of charge or voltage across two opposite faces. Because of the high Q of the crystal changes and voltage variations have little effect on the resonant frequency and a high measure of stability is realized.

It is possible to cut a quartz crystal from the mother quartz so that the frequency of vibration of the quartz plate will be substantially independent of temperature changes. For example, for temperature changes of 100°C the frequency variation can be maintained to less than .015%. In certain types of cuts can maintain constant frequency within .002% for a temperature change of about 75°C , more than the normal temperature variation encountered in receivers and even in automobiles.

The aging problems formerly associated with crystals have been substantially eliminated. (A subsequent article will deal with the aging of crystals, its manifestations and its elimination, and will cite experimental illustrations of the cure.)

The variation in frequency of properly finished crystals has been found to be less than .0005% over a period of two years. At 100 mc this would correspond to a frequency change of less than 500 cycles.

It is possible to hermetically seal the quartz crystal to eliminate humidity effects and inhibit temperature variations. The thermostatic control of temperature is easily accomplished, even in extremely small spaces. For final receiver applications ambient temperature changes will have negligible effects on the frequency of operation and temperature control is unnecessary.

It is possible to house a complete quartz plate in a container about the size of the postage stamp type container. If necessary the space required may be as much as one cubic inch.

There are no inductive fields arising about and the physical placement of the crystal is less critical than the placement of a coil in a resonant circuit. For postwar applications the quartz plate will almost certainly require not more than one-half to one inch of space in a receiver. For very high-frequency applications the quartz will probably be molded in a plastic container with two leads protruding in much the same manner as resistors, capacitors and fuses are now manufactured.

Mass production techniques introduced into the manufacture of

(Continued on page 86)

PLUGS and JACKS

...for every known application!

Built in accordance with latest Signal Corps and Navy specifications, Amalgamated Plugs and Jacks are tropicalized to make them fungus resistant, waterproof and moistureproof when called for. Insulators of these components are designed to withstand extremes of temperatures for -67°F to $+167^{\circ}\text{F}$, at humidities up to 100%. We also specialize in producing Plugs which will bear up under the high heat met in rubber molding cord sets.

NOTE: Amalgamated Engineers will gladly consult with you on the design and development of Plugs and Jacks for special applications — present or postwar.

PLUG PL-55 and N.A.F. 1136-1

Long sleeve, two-conductor plug, mate to Jack JK-34-A. Withstands minimum of 60 cycles AC, potential of 500 volts effective, applied between any two terminals for not less than two seconds. Meets minimum insulation value of 2000 megohms between conductors at 68°F at humidities up to 100%.

JACK JK-26, N.A.F. 215284-2

Two-conductor Jack, mate to PL-54. Tropicalized. Withstands 60 cycle AC potential of 500 volts effective, applied between any two terminals for not less than two seconds. Meets minimum insulation value of 2000 megohms between conductors at 68°F , at humidities up to 100%.

PLUG, STYLE "A"

Two-conductor, special type plug for use with Neoprene or Buna S molded cords. Same specifications as PL-55.

JACK JK-48

Light duty, two-conductor Jack, mate to Plug PL-291 and Plug 291-A.

PLUG PL-204

Hand set. A special plug wherein both a modified Plug, PL-55 and PL-68, are held in place by a phenolic case. Same specifications as PL-55 and PL-68.

PLUG PL-54, PL-540, PL-354, N.A.F. 215285-2

Short sleeve, two-conductor plug, mate to Jack JK-26. Same specifications as PL-55.

PLUG, STYLE "D"

Two-conductor, special type plug for use with Neoprene or Buna S molded cords. Same specifications as PL-55.

crystals as a result of wartime needs will reflect greatly lower prices. Automatic machinery has been developed for manufacturing crystals in huge quantities.

In general a crystal oscillator or resonator plate can be substituted as a circuit element in place of a lumped capacity and inductance. The equivalent circuit of a quartz crystal plate in an air gap mounting is illustrated in Figure 7. Note that the crystal plate can be excited to resonate or oscillate over a narrow band of frequencies, depending upon the associated circuits. The *resonant frequency*, f_R , is the series resonant frequency and is a function of the equivalent L and C of the crystal element itself. The *antiresonant frequency*, f_A , is the parallel resonant frequency, and is a function of the equivalent L and C of the crystal element itself and the dielectric capacity of the quartz in shunt with the equivalent L and C . The airgap capacity influences both the series and the parallel resonant frequencies. With plated crystals, the electrodes are deposited directly on the surface of the quartz and the effective air gap is negligible.

Plated crystals will probably be most widely used in radio receivers because of the potential simplicity of manufacturing processes for mass production, with consequent low cost.

Part II Data

The next installment will discuss the actual use and application of crystals and crystal circuits for both push-button spot-frequency tuning and for dial or continuous-coverage tuning in radio receivers.

SKIN EFFECT

(Continued from page 60)

curves as accurate as their scale permits.

At very-high frequencies the depth of penetration of current becomes so slight that curvature of the conductor surface is negligible. The conductor then shows conductivity proportional to the circumference and to the depth of penetration; that is, it behaves as if it were a section of a flat conductor of infinite width. Resistance per centimeter square of such a conductor is:

$$R_s = \frac{\rho}{\delta} = \rho \left[2\pi \sqrt{\frac{\mu f}{\rho}} \times 10^{-9} \right]$$

$$= 2\pi \sqrt{\rho \mu f} 10^{-9}$$

ohm per cm square

Resistance per cm length of round conductor is then:

$$R_r = \frac{R_s}{\text{Area}} = \frac{R_s}{2\pi r_o} = \frac{\sqrt{\rho \mu f} 10^{-9}}{r_o}$$

ohm at extremely high frequency

Resistance per cm length at low frequency or d-c is:

$$R_o = \frac{\rho}{\pi r_o^2}$$

Ratio of high-frequency resistance to d-c resistance is then:

$$\frac{R_r}{R_o} = \frac{\sqrt{\rho \mu f} 10^{-9}}{r_o} \times \frac{\pi r_o^2}{\rho}$$

$$= \pi r_o \sqrt{\frac{\mu f}{\rho}} \times 10^{-9}$$

$$= \pi \frac{d}{2} \sqrt{\frac{\mu f}{\rho}} \times 10^{-9}$$

but this is equal to $r_o/2\delta$. At high frequency, therefore, the resistance ratio is simply $\frac{1}{2} K$. It may be demonstrated in a similar way that the inductance ratio at high frequency approaches the value

$$\frac{L_r}{L_o} = \frac{2}{K}$$

The curves extend to $K = 100$, at which condition the exact value of resistance and reactance ratios differs by less than 1% from the values $K/2$ and $2/K$ respectively. At the lower end of the curves, the skin effect corrections are 2% for resistance and 2% for inductance. These curves therefore cover the entire range of values for which skin effect computations are difficult; if K is below 1.0 the correction is, for most purposes, negligibly small, and if K exceeds 100 the multiplier is $K/2$ for resistance and $2/K$ for inductance.

LARGE

B&W heavy-duty rotary coils of this type are admirably suited for dielectric heating, as well as a wide variety of other uses.

MEDIUM

Ideal general purpose rotary coils. Current carrying capacity approximately 15 amps. In a wide range of inductance values

SMALL . . . This little coil has dual opposed windings and is continuously variable—a typical example of B&W construction applied to a special design.

GENERAL PURPOSE ROTARY COILS

...in a wide range of inductances, voltages and capacities

Typical of the completeness and engineering supremacy of the general line of B&W Air Inductors, these rotary coils are available in standard or special types, sizes, and shapes to meet practically any rotary coil requirement. Bring your coil problems to coil headquarters! B&W engineers will gladly make recommendations based on an unparalleled experience in this specialized, rapidly advancing field.

BOOK TALK

TRANSMISSION LINES, ANTENNAS AND WAVE GUIDES

By **Ronold W. P. King** and **Harry Rowe Mimno**, Associate Professors of Physics and Communication Engineering, Harvard University; and **Alexander H. Wing**, Electronics Lecturer, Harvard University . . . 338 pp . . . New York: McGraw Hill Book Co. . . . \$3.50.

This book is the outgrowth, with some additions, of preradar training lecture material presented at Cruft Laboratory, Harvard University.

The treatment is largely non-mathematical and is qualitative in aspect. There are four chapters, with a list of pertinent references at the end of each chapter. An excellent group of problems which are especially well chosen to test the ability of the student or reader, are also presented.

Chapter I

Chapter I (by Dr. Wing) treats transmission lines from the conventional electric-circuit theory point of view and contains enough mathematics to emphasize the factors entering into their consideration. In the sections relating to the *skin effect*, several formulas based upon a *well-developed skin-effect* are offered.

Chapter II

Chapter II (by Dr. King) deals with the complex subject of antennas and their coupling to the universe by a qualitative discussion in terms of electromagnetic theory. Ordinary electric-circuit theory is shown by several well chosen examples to give erroneous results which may, in some cases, lead to conclusions exactly opposed to those found by recourse to the more general electromagnetic theory. A number of well chosen graphs make up for the lack of extensive mathematical treatment. Co-linear and parallel antenna arrays are well discussed and a table of the function $\sin Nx / (N \sin x)$ is given to reduce the labor involved when making calculations of the array factor for N parallel identical antennas having equal current amplitudes but differing progressively in phase by delta radians.

Chapter III

Chapter III (also by Dr. King) is a sequel to the study of antennas in that the same general principles governing electric circuits having dimensions comparable with or greater than a wavelength are applied to circuits

of a different type. These circuits utilize the ultrahigh-frequency regions and are associated with the fact that their dimensions are of the same order of magnitude as the wavelength. They are known by the general term of wave guides. A qualitative discussion coupled with a large number of graphs showing the distribution of the electric and the magnetic fields in several types of guides help to formulate ideas of the manner of propagation and the performance of these guides. Cavity resonators receive but two of the fifty-eight pages in this chapter, but this should not be too surprising since most of the data had been restricted since before the outbreak of war.

Chapter IV (by Dr. Mimno) is a very general discussion on wave propagation to acquaint the student with a few of the practical propagation difficulties met with when attempting to place the theories into practice. Sky distances with time of day, night or season; sporadic ionosphere layers; irregular reflections from objects such

s buildings and mountains are each shown to contribute to variability in the propagation of these waves.

The physical points of view and the analogies used throughout the text are invaluable factors to bridge the gap between an elementary readable text and a highly mathematical treatise.

The treatment of material throughout the book is scholarly and thorough.

ELECTROMAGNETIC ENGINEERING (Vol. I, Fundamentals)

by **Ronald W. P. King**, Associate Professor of Physics and Communication Engineering, Harvard University . . . 68 pp . . . New York: McGraw Hill Book Co. . . . \$6.00.

This, the first of three volumes on the subject of *Electromagnetic Engineering*, is a systematic study of fundamentals.

To those who have never been exposed to the broad concepts of electromagnetic theory, the book will appear to be fairly complex. However, every effort has been made to simplify reading. For instance the author offers a compilation of nomenclature used throughout the text with explanatory data. A unique numbering system to identify equations and figures more rapidly is also used to simplify text study. The numbering system is excellent and merits consideration for more widespread adoption by other technical writers.

A working knowledge of calculus and complex algebra with some familiarity with elementary differential equations is essential for the reading of this work. Vector analysis is used throughout the text, but is introduced in terms of fundamental electromagnetic concepts rather than the more formal mathematical symbolism.

The Maxwell-Lorentz equations that define the electromagnetic field are shown first to consist of four simultaneous, partial differential equations of the first order. These are then transformed into the integral relations that are so often found to be more convenient in the solutions of problems. This is especially true when the boundary conditions are sufficiently simple, and when the problems are characterized by symmetry. The *skin effect* and internal impedance of various types of tubular conductors are dealt with by means of Bessel's functions.

An analysis of electric circuits is given, utilizing the concepts of electromagnetic theory. Circuits comprising the coaxial line, two-wire lines and

(Continued on page 91)

CLOSEUP OF A NICE JOB

We can honestly say that Electronic Winding coils are getting better and better. They have had to be better to satisfy the insistent demands of communications branches of the armed services and to contribute to the dependability of rugged radio equipment that is helping to save lives all around the world. This closeup of a nice job of coil winding shows a complete RF assembly—just one of the many precise jobs we can do. If specifications call for a coil of extra quality call on Electronic Winding.

NEWS BRIEFS

GERMAN RADIO DEMOBILIZATION STUDY COMPLETED

A study of means for demobilizing German radio and electronic industries to prevent their use in a future war has been completed and a report has been filed with the Foreign Economic Administration.

The committee is headed by Ray C. Ellis, former Director of the WPB Radio & Radar Division and now a special consultant at Johns Hopkins University. Its membership includes Ralph Bown of Bell Laboratories and the Office of Scientific Research and Development; Louis J. Chatten, former director of WPB Radio & Radar unit; Capt. F. C. Layne, Chief of the Navy Electronics Division; Capt. Gilbert Myers, USN, secretary of the Joint Communications Board, and Brig. Gen. T. C. Rives, Deputy Air Communications Officer, AAF Headquarters.

NOBLE IN NEW GALVIN POST

Daniel E. Noble has been appointed general manager of the communications and electronics division of Galvin Manufacturing Corporation, 4545 West Augusta Blvd., Chicago 51, Illinois. In his new position Dr. Noble will have direct authority over the engineering, sales and engineering production departments of the division. He will retain his present responsibilities as director of research.

FINCH PROMOTED BY NAVY

W. G. H. Finch has been promoted to Captain, USNR.

Captain Finch formerly was assistant chief engineer of the FCC and in 1935 founded the Finch Laboratories of which he was president. He relinquished his post as president just prior to Pearl Harbor and volunteered for active duty with the United States Navy.

MOUNTJOY TO HEAD LEAR RESEARCH ACTIVITIES

Garrard Mountjoy, who has been in charge of research and development work in the radio division of Lear, Incorporated, has been advanced to take charge of all research and development work in the New York laboratories of Lear. Richard A. Marsden, previously in charge of research activities, has resigned to devote his time as patent counsel, and will continue to act in that capacity for Lear.

HENRY HUTCHINS BECOMES PRESIDENT OF JOHN MECK INDUSTRIES SALES CORP.

Henry Hutchins, former sales manager of National Union Radio Corp., has been elected president of John Meck Industries Sales Corporation, 35 East Wacker Drive, Chicago, Illinois. He will direct the national sales of Meck radios.

FARNSWORTH ACQUIRES HALSTEAD TRAFFIC

Farnsworth Television & Radio Corporation has acquired all of the assets of Halstead Traffic Communications Corporation including patents

relating to railway and highway radio communications.

William S. Halstead, president of the Halstead company, will serve Farnsworth as consulting engineer on radio communications equipment and traffic control as well as on other phases of electronics. John A. Curtis, vice-president of Halstead and chairman of its management committee, has been appointed manager of the Farnsworth communications division. Most of the key personnel of the Halstead organization, including members of the engineering staff, have been added to the Farnsworth staff.

Farnsworth will transfer Halstead laboratory and manufacturing facilities to its plant in Fort Wayne, Ind.

W. S. Halstead (above)

BOOK TALK

(Continued from page 89)

Far-wire lines and their associated characteristic properties are given extensive and thorough treatment. The book concludes with several useful appendices. These are: Vector formulas and identities; tables of hyperbolic functions, \cosh and \sinh of one-half arc $\sinh h$; Bessel's functions; material constants, and dimensions and units. This book should become a reference work on the shelf of every engineer who is either engaged in or who expects to follow the field of electromagnetic engineering.

ULTRA - HIGH - FREQUENCY RADIO ENGINEERING

by W. L. Emery, former Instructor of Electrical Engineering, Iowa State College . . . 282 pp . . . New York: The Mcmillan Company . . . \$3.25.

In this book the author has attempted to cover a vast field in relatively few pages, and the result is that the reader obtains a very light exposure from a great many subjects. Many of the discussions given could scarcely be justified on other grounds than general information. For example, power supply filters, voltage doublers and phase discriminators each receive a paragraph. Many other sections scattered throughout the book relating to various techniques are all too meagerly treated and are in a practical sense a mere acknowledgment of existence. Much of the text material is of the descriptive type followed by a few equations which must be taken entirely on faith. Derivations are relatively few, but are as simple and direct as possible.

The deficiencies of the book as a text-book have been partially offset by well chosen examples of problems which follow the text material quite closely. These are supplemented by experiments which the student can conduct to confirm the results obtained from solving the problems, and to check the statements and equations given in the text. An excellent list of references is given at the conclusion of each chapter which can be contacted to fill in the gaps and to augment the material presented. The large number of references given contribute greatly to the value of the book. This text is literally a collection of notes and not a textbook in the customary sense. From this viewpoint, the book appears in true perspective and as such, it is recommended for students and engineers.

is another phase of

WAR . . .

THEY call it LOGISTICS in war . . . the difficult science of getting supplies to the fronts where they can be used. Post-War Reconversion will involve the same problems . . . just another phase of war itself.

CORWICO Wires, so long practically non-existent for American industry because of our national emergency, will figure importantly in the new Logistics of Reconversion. Soon you will be able to get these scientific strands for peacetime uses . . . and the world will stride into a new era of construction and expansion in which you'll no longer be *doing without* . . .

and general manager; and Russell G. Eggo, secretary.

SCOTT BARLOW JOINS SYLVANIA STAFF

Scott Barlow has been named editor of the Sylvania News, and assistant to H. G. Kronenwetter, advertising production manager of the radio tube division.

PRATT NOW RTPB CHAIRMAN; FRAZIER VICE CHAIRMAN

Haraden Pratt, vice president and chief engineer of the American Cable and Radio Corporation, has been elected chairman of the Radio Technical Planning Board. He succeeds Dr. W. G. R. Baker of G. E.

Mr. Pratt is also vice president of Federal Telephone and Radio Corporation.

Howard S. Frazier, NAB director of engineering, has been named vice chairman. Will Ballin, TBA secretary-treasurer, is the new RTPB treasurer.

DETROLA AND UTAH RADIO MERGE

A proposal to merge Utah Radio Products Company, Chicago, into International Detrola Corporation was approved recently.

Meetings of stockholders to vote on the proposal will be held soon.

SURPLUS DATA

Approximately 3,000 items of Government-owned surplus property which the RFC handles as a disposal agency are listed in a booklet recently published, "How To Do Business With RFC."

G. E. NAMES PETTIT TO NEW AD-SALES POST

L. E. Pettit has been named assistant to the general sales manager of the G. E. electronics department. He will coordinate advertising and sales promotion activities of the department.

RAIBOURN HEADS 1945 TBA AWARDS COMMITTEE

Paul Raibourn, president of Television Productions, Inc., economist for Paramount Pictures and a director of TBA, has been appointed chairman of the TBA awards committee for 1945.

J-B-T BULLETIN

A 4-page bulletin, VF-43-1C, describing vibrating reed frequency meters has been published by J-B-T Instruments, Inc., 441 Chapel Street, New Haven 8, Conn.

F. X. RETTENMEYER JOINS FTR

Francis X. Rettenmeyer, formerly chief receiver engineer of RCA Victor, has been named chief components engineer of Federal Telephone and Radio Corporation.

SYRACUSE U. TO INSTALL WIRED TELEVISION

Syracuse University will install a G. E. wired television system shortly after the war.

Equipment will be used to conduct various classroom teaching experiments, as well as

DC means SC...

Selenium Control in suppression of inductive arcs. By proper selection of rectifier size, release timing of the inductive mechanism is positively controlled by the same unit which suppresses the arc. In relay applications where space is at a premium, the high voltage characteristics of the Selenium plate once again prove DC means SC... Selenium Control. If you use DC... get the facts on SC!

tubes and their four fundamental uses, while the second film, "Electronic Tubes as Rectifiers," describes three important types of rectifiers, the kenotron, phanotron, and the mitron. The grid control of electronic tubes is discussed in the third film, and the fourth and fifth cover the fundamentals of electricity. Six of the remaining films are devoted to photoelectric and electronic relay systems, electronic rectifier equipment, the thy-mo-trol tube, electronic heating in industry, and the electronic control of a-c power, respectively.

WINFIELD BECOMES WESTINGHOUSE HOME RADIO CHIEF ENGINEER

W. S. Winfield has been appointed chief engineer of the home radio division of Westinghouse Electric Corporation.

Mr. Winfield was formerly with Colonial Radio, Buffalo. During 1942-43 he served as consulting engineer to the Ordnance Division of Bell Aircraft specializing in electronic devices.

MECTRON CORP. FORMED

A new electronic manufacturer, Mectron Corporation, Inc., has opened a plant in Lawrence, Mass. Anthony Lambo is vice president and general manager.

WILLS APPOINTED FCC COMMISSIONER

Ex-Governor William H. Wills, of Bennington, Vermont, recently became a member of the Federal Communications Commission, succeeding Norman S. Case.

He was appointed by President Truman on June 13, and was confirmed by the Senate on July 12.

SNODGRASS JOINS W. E. HEARING-AID DIV.

William E. Snodgrass, formerly executive vice-president of the Dictograph Products Company, has joined Western Electric as general manager of the hearing-aid division.

RCA SCHOLARSHIP PLAN

A scholarship plan providing for as many as ten students to receive \$600 yearly scholarships during the academic year 1945-1946, thirty during 1946-47, fifty during 1947-1948, and sixty each academic year thereafter, has been announced by RCA. Those eligible will include all students enrolled at universities to be selected by the RCA education committee.

On the committee are Dr. James Rowland Angell, president emeritus of Yale University and public service counselor of NBC, who is chairman; Gano Dunn, president of the J. G. White Engineering Company, president of Cooper Union and a director of RCA; Dr. C. B. Jolliffe, vice president in charge of RCA laboratories, and F. H. Kirkpatrick, director of education and training, RCA Victor Division.

KNOOP OF DU MONT PRESENTS C-R PAPER TO IRE

A paper covering the applications of the cathode-ray oscillograph was offered by Walter A. Knoop, Jr., of the engineering staff of Allen B. Du Mont Laboratories, Inc., before the Red Bank (N. J.) section of the IRE recently.

Variaten Gain Set 1901-B

As necessary to perfect Amplifier performance as the fourth leg to a dog!

You can't have perfect performance in amplifying or other speech transmission without knowing the efficiency and performance of each unit in the installation.

With a Variaten Gain Set you can (1) measure the total amplification of an amplifier; (2) measure the gain at all frequencies to determine whether there is discrimination against any part of the frequency spectrum; (3) measure the power output of any amplifier; (4) measure frequency response of transmission lines in absolute quantities; (5) check all control equipment—in fact, quickly make a quantitative analysis of any part of the audio frequency spectrum.

Unvarying accuracy is all-important. Variaten Gain Set, Type 1901-B (shown above) has a flat frequency characteristic of 0 to 20 kilocycles, and leakage is *guaranteed to be less than 1/10th db.* (Measurements have been made at frequencies as high as 100 kilocycles with practically no error.)

Variaten Gain Set 1901-B is equipped with both send and receive impedance matching controls for *both* Straight T and Balanced H circuits. This dependably accurate instrument can be supplied with either one or two meters.

Write today for complete data on Type 1901-B and other Variaten Gain Sets

Other Variaten products—*Attenuators, Mixers, Resistors, Matching Pads and other precision sound equipment meet the most exacting specifications. Catalog on request.*

A 24-page capacitor reference manual has just been released by The Magnavox Company, Fort Wayne, Indiana.

Offered are reference material for all standard sizes of Magnavox capacitors available, with cross reference to standard production numbers. In addition, anode size factors, leakage limits and resistance limits are charted.

ELECTRONIC COUNTER

(Continued from page 81)

circuit will be used to count a fixed number of pulses or a number that will vary slightly from some fixed number. Although the setting of P_1 will determine how many pulses the circuit will pass before it is triggered, the ratio of the sizes of C_2 and C_1 will help to determine the stability of operation of the circuit.

The degree of stability of the circuit depends upon the size of the *step* in voltage, as shown in equation 12. The larger the step the less likely will be the possibility of any *drifting* or changing in counting. Obviously, then, maximum stability will be possible when S_n is also a maximum. This condition exists when the derivative of S_n with respect to r is equal to zero. The derivative of S_n is

$$\frac{d S_n}{d r} = \frac{d}{d r} [r E_M (1-r)^{n-1}]$$

$$= E_M [(1-r)^{n-1} - r (n-1) (1-r)^{n-2}]$$

or

$$\frac{d S_n}{d r} = E_M (1-r)^{n-2} (1-nr) \quad (13)$$

Setting equation 13 equal to zero, two solutions present themselves. The first gives r the value 1; the other gives r the value $\frac{1}{n}$. Applying these solutions

to our original definition of r , namely,

$$r = \frac{C_1}{C_2 + C_1}$$

it is seen that if r is equal to 1, C_2 must be zero which is obviously an impractical solution. Using the other value

of r , which was $\frac{1}{n}$,

$$\frac{1}{n} = \frac{C_1}{C_1 + C_2} \quad (14)$$

Solving equation 14 results in

$$C_2 = (n-1) C_1 \quad (15)$$

Equation 15 tells how large C_2 should be with respect to C_1 for maximum stability. Whenever the circuit suggested here is used, either as a counting device or as a frequency divider, the conclusion reached in equation 15 should be observed as closely as possible. This is especially true since there is bound to be some slight leakage in the condensers, and some variation in their indicated value, which will tend to make the circuit operate with some degree of inefficiency no matter how carefully the elements are chosen. Condensers C_1 and

ELECTRONIC COUNTER

(Continued from page 97)

C_2 are the most important elements in the circuit. They should be of mica and well made to keep leakage down to a minimum.

A few unusual effects should have been apparent from a study of the waveshape for E_p of the blocking oscillator circuit. Although the voltage dropped at first, it was probably noted that when it started to return to $B+$ again as the tube was cut off once more, E_p actually rose above $B+$. This was due to the collapsing lines of force (within the inductance of the transformer) which tended to oppose any changes in the direction of current flow. It was probably also noted that oscillations continued after the output pulse. These oscillations were due to distributed capacitance (between the windings of T_1) which caused the secondary of T_1 to act as a tuned tank circuit. These oscillations dampen out very quickly and do not appreciably alter the operation of the circuit. Only the first pulse will be of sufficient amplitude to be of any practical use.

Constant Amplitude Pulses

In this discussion the assumption has been made that the pulses being counted are of constant amplitude. However, should the input signal consist of pulses of varying amplitude, each pulse *step* will also be irregular in amplitude causing the blocking oscillator (or other pulse output device) to respond after a varying number of input pulses.

If the circuit described in this paper is to be used to count pulses of varying amplitude, it will be necessary to precede the counting circuit with a limiter stage whose function is to maintain the input pulses at a constant level. Several types of limiting circuits are suitable for this purpose, the most frequently used being the biased diode limiter and the saturated pentode limiter. Each type of limiter has its advantages and disadvantages but it will be found that, in general, the saturated pentode limiter is simpler and more satisfactory since it eliminates biasing requirements and provides some voltage gain. The principal disadvantage of the saturated pentode limiter is that the phase of the input pulse signal will be inverted and may require another amplifying stage prior to the input to the counter circuit. The phase inversion may be eliminated, if need be, by connecting the saturated pentode limiter as a cathode follower (in which case, this stage would no longer provide any voltage gain).

PORTABLE POWER PROBLEMS

THIS MONTH — BROWN-DUVEL MOISTURE METER

BURGESS INDUSTRIAL BATTERIES power the Brown-Duvel Moisture Tester, made by Seedburo Equipment Co., for the determination of moisture content in grain. And in thousands of similar industrial applications Burgess Batteries are providing the power for electronic test equipment. Purchasing agents and maintenance engineers know they can get a Burgess Battery for every need from their local Burgess distributor. For information on the *complete line* of dry batteries for all test and control instruments, write for the name and address of your nearest Burgess distributor.

ELECTRONIC ENGINEERS VOTED Burgess Industrial Batteries first choice in a recent nationwide survey of dry battery preferences! If you need a special battery for a new instrument or a new application let Burgess engineers solve your problem with the correct battery type. *Burgess Battery Company, Freeport, Illinois.*

THE JOB AHEAD — JAPAN!

BURGESS BATTERIES

VOTED FIRST BY ENGINEERS
IN NATION-WIDE INDUSTRIAL BATTERY SURVEY

Recognized as the MOST COMPLETE LINE of dry batteries

JENNINGS HIGH-VACUUM CAPACITORS

Four high-vacuum capacitors ranging from 1 mmfd at 7½ amperes, 3,000 peak volts, to 250 mmfd at 60 amperes, 20,000 peak volts and a special high-power unit of 50,000 peak voltage, 60 amperes peak, have been announced by Jennings Radio Manufacturing Company, 1098 East Williams Street, San Jose, California.

FTR BATTERY CHARGERS

Automatic telephone selenium rectifier chargers, FTR-8,000-S, providing d-c outputs ranging from 2.4 to 16 amperes for from 12 to 60 cells, has been developed by Federal Telephone and Radio Corporation. Output voltage ranges from 2.1 volts per cell at high rate charge to a trickle volt charge of 2.25 volts per cell.

Battery potentials are said to be automatically maintained within selected limits by a voltage control relay circuit which varies the charge between high and trickle rates, both of which are adjustable. The unit is said to be designed to operate without automatic regulation if necessary, permitting the rate of charge to be adjusted manually when desired. An alarm circuit is provided to indicate failure of charger or battery circuits, both of which are equipped with fuse protection and overload switches.

For single phase, 60-cycles, 110, 130, 200, 220 and 250 volts.

ROGERS INSULATING BOARD

A non-cotton cellulose electrical insulating board, Durok, with a dielectric strength from 400 to 600 volts per mil, has been announced by Rogers Corporation, 9 Mill Street, Manchester, Conn.

Material is said to be neutral, since it is not chemically treated or sized; said to dry out with a short baking cycle and absorbs insulating varnish.

The material is made by laminating many thin, continuous layers while wet under high

pressure, without the use of adhesives or chemicals, then drying without any tension. Stock sheet sizes are 36" x 48" and 36" x 24", with the grain direction parallel to the second dimension. Thicknesses now available are .015", .020", .025" and .030".

AIRCRAFT TOOL DRILPILOT

A tool, Drilpilot, that is said to permit drilling and countersinking, drilling and spotfacing, or drilling and counterboring in one operation, has been announced by Aircraft Tools, Inc., 750 E. Gage Avenue, Los Angeles, California.

Body of drill is 5/8" long with a 9/16" flute length. Shank is .086 diameter and 3/8" long. Comes only in standard rivet sizes 40, 30, 21 and 10.

Used with standard angle drill adapters or angle drill attachments. Can be used in connection with replaceable shank countersink or replaceable shank spotfacer.

TRIPLETT HERMETICALLY SEALED INSTRUMENTS

Panel flush mounting 1 1/2", 2 1/2", 3 1/2" meters (a-c and d-c), hermetically sealed, have been produced by Triplett Electrical Instrument Co., Bluffton, Ohio.

Mechanisms are D'Arsonval d-c and repulsion moving iron a-c type, furnished in 2 1/2" and 3 1/2" seamless metal cases, 1 1/2" in d-c only. Instruments have the same case sizes and conform in performance to JAN-1-6 specifications. They also comply with S.C. No. 71-3159 and A.C. 45A40327 specifications. Zero shift on the instrument is said to not exceed ± 2%; accuracy, 2% of full scale.

Models 321-HS (3 1/2") round, 221-HS (2 1/2") round, and 127-HS (1 1/2") square made in d-c voltmeters, ammeters, milliammeters and microammeters. Models 331-HS (3 1/2") round and 231-HS (2 1/2") round made in a-c voltmeters, ammeters and milliammeters. Models 341-HS (3 1/2") round and 241-HS (2 1/2") round available in r-f ammeters and milliammeters (a-c thermocouple type).

ACA REGULATED POWER SUPPLIES

A series of saturable-reactor regulated-power supplies for applications requiring d-c voltages regulated to better than 5% from full load to no load, and having less than 1% ripple under full load conditions, has been announced by Amplifier Co. of America, 398 Broadway, New York 13, N. Y.

Units are available in 24 v 1/2 ampere, 24 v 2 ampere, 48 v 1/4 ampere, 48 v 5 ampere (combination 24 and 48 v 750 ma), 36 v 1 am-

pere, 110 v 8 ampere, 120 v 200 ma, 135 v 1/2 ampere, 250 v .4 ampere, and 500 v 200 ma.

Power packs may be furnished with built-in automatic voltage regulators to compensate for line voltage changes.

Power packs employing heavy-duty rectifier tubes are provided with built-in thermal time delay relays which apply plate supply voltage approximately 30 seconds after rectifier filaments are heated.

BENDIX CRYSTAL AND HOLDER ASSEMBLY

Crystals, type mx-9, for 250-10,000 kc with tolerances of 0.01% at 20° for 250-1200 kc and .02% for 1200-10,000 kc, have been announced by Bendix Radio, Baltimore, Md.

Bendix engineers say that crystals will operate satisfactorily at any air temperature between -40 and +55° C.

GREEN LOW-VOLTAGE RECTIFIERS

Low-voltage stabilized high-current rectifiers rated at 200 amperes, voltage range zero to 3 volts, have been developed by Green Electric Co., 130 Cedar Street, New York City. Any voltage selected in range is said to be maintained to within 50 millivolts over load variation from zero to 200 amperes, and with line voltage variation of ±10%.

Voltage stabilization system includes motor-driven powerstat and electronic pilot device.

IDEAL COMMUTATOR SENSITIVE BALANCING WAYS

Balancing ways that use "scale type" bearings in a 10" size that are said to provide a sensitivity to .007 ounce inches has been announced by the Ideal Commutator Dresser Company, 4025 Park Avenue, Sycamore, Illinois. Bearings used in the 20" and 42" size are said to permit an accuracy in balancing to .009.

The work is carried on free turning discs. Discs are ground on outside diameters, and mounted on ground spindles.

Four sizes are available, 10", 20", 42" and 60" swing; 400, 1,000, and 5,000 pounds capacity, respectively.

G.E. 1 1/2" PANEL INSTRUMENTS

Two types of 1 1/2" meters for d-c, r-f and a-f work, have been announced by G. E. One type DN-1, 2 and 3, has a watertight design for application where the equipment may be accidentally submerged in water, exposed to rain, or used in extremely humid climate. The other model, DN-4, 5 and 6, uses a conventional design for use in aircraft or for other service where the instrument will be protected from the elements.

Both instruments have the same basic design

static shield between primary and secondary grounded to the core and brought out to a separate terminal.

Units with capacities of 500 va to 2,000 va are available. The 500 va measures 7" x 9" x 4 1/2" deep; weight, 20 lbs. The 2,000 va measures 10" x 10" x 8" deep; weight, 50 pounds.

Unit illustrated is model LW 43 AX, capacity 600 va.

AMERICAN MOLDED PLASTIC PIPE SEALS

Plastic pipe seals and thread protectors in countersunk pattern have been announced by American Molded Products Company, 1644 N. Honore Street, Chicago 22, Illinois.

Sizes available: 1/8", 1/4", 3/8", 1/2", 3/4". Fits commercial square bars of standard sizes.

SKYWAY SPINTITE TORQUE TOOL

A tool, Tork-Tite, featuring torque limiting action and torque settings calibrated in inch ounces, has been announced by Skyway Precision Tool Co., 3217 Casitas Avenue, Los Angeles, Calif.

Presented in two models with either fixed or adjustable torque settings.

MICA INSULATOR LAMICOID

A laminated plastic, Lamicoid, is now available in sheet form for post-forming, from the Mica Insulator Company, 200 Varick Street, New York 14, N. Y.

According to Mica Insulator, suitable molds and dies for post-forming stock can be made of hard wood, resin-bonded wood, metal forms, cast resin, kysite and similar materials.

The sheets measure 36"x42" and are made in thicknesses of 1/32" and over. The stock is available, in two types: E-527, for deep drawing and forming of intricate parts; and E-528, for ordinary forming and shallow drawing.

CHATHAM ELECTRONICS XENON FILLED HIGH-VOLTAGE RECTIFIERS

High-voltage xenon-gas rectifiers that are said to feature high peak inverse voltage rating, constant voltage drop, heavy current capacity and a wide ambient temperature range have been produced by Chatham Electronics, 475 Washington Street, Newark 2, New Jersey. Tube operates through an ambient temperature range of -75°C to $+90^{\circ}\text{C}$.

Characteristics (up to 150 cps): Filament voltage, 2.5 volts a-c; peak inverse voltage, 10,000 volts; peak anode current, 1 amp at 10,000 volts; peak anode current, 2 amp at 6,500 volts; average anode current, 250 ma at 10,000

in utilizing an internal-pivot element combined with the permanent-magnet moving-coil construction. The pivots are mounted on the inside of the armature shell, instead of being secured to the outside of the armature winding.

SCHRILLO COUNTERSINK

A micrometer adjustable countersink, model

6300, has been produced by Schrillo Aero Tool Engineering Company, 8715 Melrose Avenue, Los Angeles 46, California. Tool has a cutter capacity of 7/8" diameter. Cutters are driven off a 7/16"-20 threaded shank or a standard taper.

Features a self-lubricating bearing. Adjustments are made in increments of .001". Taper shank cutter style has a self-contained knock-out pin.

GULOW ISOLATION VARI-FORMERS

Transformers, vari-formers type W, with primaries wound for 115 volts input and variable secondaries wound for an output of 0-130 volts, have been announced by Gulow Corporation, 26 Waverly Place, New York 3, N. Y. Units can be connected as autotransformers. Inputs of 115 or 220 volts can be applied and output ranges of 0-65 or 65-130 are obtainable with increments of 0.3 volts. Likewise output ranges of 0-130 or 115-245 with increments of 0.6 are possible.

Separate primary and variable secondary windings wound on the same core. Electro

volts; average anode current, 500 ma at 6,500 volts; maximum height, 6.38"; and maximum diameter, 2.07".

Characteristics (up to 500 cps): Peak inverse voltage, 6,500 volts; peak anode current, 2 amp; and average anode current, 500 ma.

TECH APPARATUS SELF-REGULATING POWER PACKS

A power pack, 1220 EB, providing two voltage-regulated d-c outputs covering the ranges commonly used for anode and bias voltages has been announced by Technical Apparatus, 1171 Fremont Street, Boston 20, Mass.

High-voltage output is continuously adjustable from zero to 400 volts. Voltage is said to be automatically held at its initial setting under load variation from zero to full current. Maximum current output on the anode supply is 250 ma; maximum power output, 40 watts. Regulated bias voltage is continuously adjustable from -100 volts to 0 at maximum current of 2 ma.

Instrument contained in a steel housing 13" by 11" by 9".

QUICKCET VISE

A 3" vise equipped with a trigger release pawl with $\frac{3}{4}$ " of thread which holds a screw under spring tension has been announced by Grand Specialties Co., Grand Avenue at Troy, Chicago 22, Ill.

Vise known as Quickcet, is said to open instantly to full 3" by pressure of thumb or finger on trigger release after tension has been eased by a turn of a looseproof handle.

INDUSTRIAL INSTRUMENT RESISTANCE LIMIT BRIDGES

A resistance-limit bridge (modified Wheatstone) to check resistors between 1 ohm and 3 megohms, working to $\pm .1\%$ has been announced by Industrial Instruments, Inc., 17 Pollock Ave., Jersey City 5, N. J. Known as model LB-3, this bridge has high and low limit dials covering a range of $\pm 11\%$ in .1% steps, and uses a sensitive built-in galvanometer to provide for high and low indication, respectively. In the normal operating position the zero on the galvanometer scale acts as a reference point.

For most measurements the galvanometer and internal 3 volts d-c source will be found satisfactory. For measurement of resistors above several thousand ohms and particularly

(Continued on page 104)

Something New for the RECORD

With the advent of new plastics and recording techniques, phonograph records of tomorrow will be pressed in finer-grain, noise-free materials. Recordings, however, can be no better than the pickup arm used in their reproduction. It remained for The Astatic Corporation, therefore, to design a new pickup with advanced characteristics equaling those of the new recordings. This has been accomplished by Astatic through improved featherweight action made possible with the introduction of vertical compliance and new damping materials. The greatest possible fidelity of sound reproduction from these advanced products, so dependent upon each other, will result, therefore, in an ever increasing measure of phonograph enjoyment. Production will begin when essential materials are made available.

**GETTING UP
HIGH
means
LOWER
COST**

Getting that F-M Antenna up high not only means more efficient area coverage—but it also means lower costs. Doubling the height of the antenna above ground is equivalent to squaring the transmitter power. Thus, a 250 watt transmitter with a 200 foot tower would equal a 1000 watt transmitter with a 100 foot tower. That is real economy—both in initial transmitter cost and in power.

2 Wincharger Products will help you get better F-M Broadcasting at lower costs: (1) A sturdy, economical Wincharger Tower to get your antenna high. (2) An efficient, low cost Wincharger F-M Antenna. For full information write or wire us.

THE INDUSTRY OFFERS . . . —

(Continued from page 103)

when the resistance range is increased above 1 megohm, an external battery is recommended. For low-resistance measurements particularly below 10 ohms, a more sensitive external galvanometer may be desirable, although most measurements between 1 and 10 ohms may be satisfactorily made by using an external 1½-volt battery.

ANDREW H-F AIRCRAFT OSCILLATOR

A portable, battery-operated oscillator, type 291, for checking h-f aircraft receivers has been announced by Andrew Company, Chicago 19, Illinois.

Instrument has a frequency range from 49 to 154 mc with modulation frequencies of 70, 90, 400, 1,300, and 3,000 cycles. Contains a collapsible antenna and two coaxial terminals for low- and high-level outputs.

ELECTRONIC MEASUREMENT POWER SUPPLIES

A power supply with continuously variable voltage, 0-325 volts d-c at 125 ma without switching, has been announced by Electronic Measurements Company, 10 West Front Street, Red Bank, N. J.

Regulation of unit, model 200-B, is said to be within 1% for voltages between 20-325 volts from no load to full load; within 2% at 10 volts from no load to full load. Hum voltage is said to be less than 10 millivolts including noise.

SUPREME V-T VOLTMETER

A vacuum-tube voltmeter, model 565, has been announced by Supreme Instruments Corporation, Greenwood, Miss.

R-f probe uses miniature h-f diode; said to be applicable from 50 cycles to 50 mc. D-c voltage circuits have shielded leads; each lead has a 20-megohm isolating resistor which also acts as part of the multiplier resistors; high input

impedance of 80 megohms on 1-volt range and 40 megohms on 500-volt range. Balanced bridge circuit uses nearly 100% degenerative feedback.

D-c voltage ranges of 0-1, 0-2.5, 0-10, 0-100, 0-250, and 0-500, and a-c voltage ranges of 0-1, 0-2.5, 0-10, 0-100, and 0-250 provided by means of push-buttons.

TECHRAD CAPACITORS

One-to-four section capacitors with capacities of 20, 40, 120 and 230 mmfd, have been produced by Technical Radio Company, 275 Ninth St., San Francisco. Overall dimensions of capacitor are 5½" x 5¼". Designed originally for the output section of a pi-network.

Typical spacing is .080". Capacitors can be supplied with spacing to .200". Aluminum plates and spacers. Brass mounting feet. Universal type of construction.

B/W TIMING CONTACTORS

A timing contactor for testing solenoids, relays, etc., has been developed by B/W Controller Corporation, Birmingham, Michigan.

The contactor consists of a synchronous motor, available in various speeds, and two micro switches operated by a cam disc fastened to the motor shaft.

Terminals are provided for wire connections. Two switches are standard equipment so that two tests can be run at the same time. The counter, for short runs, is optional. Unit is portable. All items are mounted on a steel back plate and enclosed in a 9"x12"x4" sheet metal case.

J-B-T FREQUENCY AND TIME METER

A combined frequency meter and elapsed time meter, 31-FE, has been developed by J-B-T Instruments, Inc., New Haven, Conn.

Frequency or speed is said to be indicated to an accuracy of ±0.3% by a bank of 5 reeds calibrated in single cycle steps from 58 to 62 cycles. The running time meter is driven by a synchronous motor, and indicates elapsed time in hours and tenths.

Operates on 110 volts, and is also available for 48 to 52 cycles and in half-cycle steps for

Now CANNON ELECTRIC CONNECTORS for Railway Signal Relays!

Railway Signal Relays can now be changed out for testing, inspection and repair in a fraction of the time it used to take. All circuits are plugged in or out in a single operation with no misplaced connections.

The new Cannon railway signal relay plug is a special design to meet a special need. There are no soldered terminals, for instance, so that installation can be made in the field. The plug fits the limited space available in the average relay case. It is adaptable to various point combinations.

And there are other special Railway plugs in the Cannon line—a circuit switching plug, a terminal strip plug, a portable telephone plug. But there are literally thousands of *standard* Cannon Plugs available for as many different circuits and circuit combinations.

Cannon will make plugs to fit your particular needs whatever they may be. Or you may find in the Cannon Catalog just the type and size of connector you require. Take advantage of this complete service.

Write Dept. A-121, Cannon Electric Development Co., 3209 Humboldt St., Los Angeles 31, Calif., for a Condensed Catalog, or talk it over with a Cannon engineering representative, located in your city or near by.

BAKELITE LOW-LOSS PLASTICS

A low-loss phenolic mica-filled plastic molding material, BM-16981, that is said to be especially suitable in high-frequency circuits, has been developed by the Bakelite Corporation, 300 Madison Avenue, New York 17, N. Y.

The volume resistivity of the plastic is said to have remained high in a recent test decreasing from 1×10^9 megohms to 1.6×10^5 megohms. The plastic was immersed for 3,600 hours in 50°C water during the test. At 1 megacycle, the power factor was 0.055.

OPERADIO DUAL AMPLIFIERS

A 40-watt dual amplifier, the Soundcaster, designed for either plant broadcasting or public address service, has been announced by Operadio Manufacturing Company, St. Charles, Illinois. Three models are available.

The basic Soundcaster, 1335, is for continuous use. Model 531 incorporates a two-speed, manually-operated, record player for 10" and 12" commercial recordings, or 16" transcriptions. Model 530 features an automatic rec-

Weights approximately 45 pounds.

STANDARD MOLDING PLASTIC BOXES

Plastic transparent boxes designed to hold V-mail films and other similar objects have been developed by Standard Molding of Dayton, Ohio.

FAIRCHILD WIRE-WOUND POTENTIOMETERS

A non-linear, wire-wound, potentiometer has been announced by the Fairchild Camera and Instrument Corporation, New York.

Fairchild engineers say that tolerances of $\frac{1}{2}\%$ or better have been consistently reached for certain curves.

The potentiometer was developed for use in bridge T attenuators in a Fairchild airborne electronic computing gunsight. At present, one standard size, with a $1\frac{1}{8}$ " outside diameter is available. The model now in manu-

facture can be used singly or stacked; it has been banked to 18 on one shaft. Linear units are also available.

S-M FRACTIONAL H-P MOTORS

An a-c/d-c fractional h-p motor, SM-4, has been developed by Small Motors, Inc., 1308 Elston Avenue, Chicago 22.

The motor's rating is from 1/50 to 1/10 horsepower. It is $3\frac{5}{16}$ " in diameter, $4\frac{3}{16}$ " long; height with base is $3\frac{3}{8}$ ".

It is made to order at speeds from 2,000 to 10,000 rpm with precision oil bearings, and from 10,000 to 20,000 rpm with oilless sleeve bearings. Made in shunt and series windings for d-c, and universal for a-c/d-c.

G.E. B-F AUDIO OSCILLATORS

Beat-frequency audio oscillators, type AO-2, using full vision and making possible direct calibration, have been announced by G.E. Unit provides a sine wave, and continuous variable frequency from 25 to 15,000 cps.

A 6E5 electron-ray tube is used to indicate zero beat while adjusting the panel control knob to obtain the proper relationship between the two high-frequency oscillators. Maximum output is 120 milliwatts on a cathode-follower type output impedance coupling circuit.

Long Scale, Wide Range Volt-Ohm-Milliammeter

DOUBLE SENSITIVITY D.C. VOLT RANGES

0-1.25-5-25-125-500-2500 Volts, at 20,000 ohms per volt for greater accuracy on Television and other high resistance D.C. circuits.

0-2.5-10-50-250-1000-5000 Volts, at 10,000 ohms per volt.

A.C. VOLT RANGES

0-2.5-10-50-250-1000-5000 Volts, at 10,000 ohms per volt.

OHM-MEGOHMS

0-400 ohms (60 ohms center scale)
0-50,000 ohms (300 ohms center scale)

DIRECT READING OUTPUT LEVEL DECIBEL RANGES

- 30 to +3, +15, +29,
+43, +55, +69 DB

TEMPERATURE COMPENSATED CIRCUIT FOR ALL CURRENT RANGES D.C. MICROAMPERES

0-50 Microamperes, at 250 M.V.

D.C. MILLIAMPERES

0-1-10-100-1000 Milliamperes, at 250 M.V.

D.C. AMPERES

0-10 Amperes, at 250 M.V.

OUTPUT READINGS

Condenser in series with A.C. Volts for output readings.

ATTRACTIVE COMPACT CASE

Size: 2½" x 5½". A readily portable, completely insulated, black, molded case, with strap handle. A suitable black, leather carrying case (No. 629) also available, with strap handle.

LONG 5" SCALE ARC

For greater reading accuracy on the Triplet RED .DOT Lifetime Guaranteed meter.

SIMPLIFIED SWITCHING CIRCUIT

Greater ease in changing ranges.

Microdyne

The Importance of SPECIALIZATION

Aside from outstanding and long-acknowledged technical skill — our "Specialization Formula" is probably as fully responsible for the world-renowned AUDAX quality as any other single factor.

We proudly concentrate all our energies and resources upon producing the FINEST pick-ups and cutters. Because we are specialists in this field, much more is expected of us. Because the production of fine instruments like MICRODYNE is a full time job, it stands to reason that we could not afford to jeopardize our reputation—EVER—by making pick-ups a side-line.

After Victory, you may expect AUDAX improvements, refinements . . . master-touches to heighten the marvelous *fac simile* realism of AUDAX reproduction.

POST-WAR BROADCAST EQUIPMENT—by G-R

● TWO of the first civilian products to come out of war research at General Radio are a broadcast station Modulation Monitor and a new Distortion & Noise Meter. These instruments have the latest circuits and new designs. Just as soon as we are out of war production these and other instruments for the broadcast station will be available again. Included will be a Frequency Deviation Meter, an F-M Monitor, a H-F Frequency Meter and Monitor, several Oscillators and other instruments. We are NOT in production on any of these now; however, information on several are available now. Brief descriptions are given below:

TYPE 1931-A AMPLITUDE MODULATION MONITOR

For program-level monitoring and for measuring transmitter audio-frequency response. Requires only 0.5 watt r-f input; carrier frequency range of 0.5 to 60 Mc; distortion is less than 0.1%; 600-ohm audio output circuit for audible monitoring; provides continuous indication of modulation percentage on either positive or negative peaks with a high-speed meter which reads both percentage modulation and decibels; measures carrier amplitude shift when modulation is applied; carrier envelope output available for distortion measurements; flashing lamp furnishes instantaneous indication of any modulation peaks exceeding any predetermined value between 0 and 100% on negative peaks. Approximate price: \$220.00

TYPE 1932-A DISTORTION & NOISE METER

For measuring a-f distortion, noise and hum levels. Equally useful in the broadcast station, the development laboratory and the production line. Continuously adjustable from 50 to 15,000 cycles, fundamental, for distortion measurements and 30 to 45,000 cycles for noise and VU measurements; distortion ranges are full-scale for 0.3%, 1%, 3%, 10% or 30% with overall accuracy for each range of $\pm 5\%$ of full scale $\pm 0.1\%$ distortion; range for carrier noise extends to 80 db below 100% modulation or 80 db below a-f signal of zero VU level; no interlocking controls, only one tuning control plus small trimmer. Approximate price: \$350.00

Place your Electronic Problem before these Temco Engineers

● Accomplished Radio and Electronic Engineers sit at this Temco Table and by combining their engineering and inventive abilities, they have produced numerous new electronic devices.

From Radar to Chronaximeters, they have designed and manufactured electronic equipment which reflects and incorporates great technical achievements. Backed by a very flexible and efficient manufacturing organization, they are one of the best equipped staffs of Engineers to consult regarding problems involving electronic equipment.

No matter how complicated your problem may appear, a Temco-engineered device can provide the answer. The Temco Table, therefore, is the best place for such problems. For proof, ask us to show you what we have accomplished for others. Write for facts today.
