PART 7. CAVITY RESONATOR TABLES

By the Engineering Department, Aerovox Corporation

The accompanying table gives dimensions of cavity resonators of square prism, spherical, and cylindrical shapes for principal mode frequencies between 1000 and 30,000 megacycles. Cavity resonators often are specified in this frequency range. The Editors believe that the three simple shapes for which dimensions are given in the table will be the most commonly available to experimenters desiring pre-calculated data.

Dimensions in the table are inside dimensions and are in *inches*. Resonant frequencies are in megacycles per second. The 59 resonant frequencies given in column 1 have 500-Mc. separation which should be adequate in most cases. However, cavity resonator dimensions corresponding to frequencies not given in column 1 may be found by multiplying the 1000-Mc. dimension (for the desired cavity shape) by $1000/f_x$, where f_x is the desired resonant frequency in mega-

cycles. For example: It is desired to know the inside diameter of a spherical cavity whose resonant frequency is 3235 megacycles. Multiply 8.35 (which is the diameter of a spherical cavity at 1000 Mc.) by 1000/3235. Thus, 8.35 (1000/3235) = 8.35 (0.3091) = 2.581 inches.

Similarly, the resonant frequency corresponding to a cavity dimension not given in the table may be found: Multiply 1000 by X/Y, where X is the dimension given for a cavity of the same shape at 1000 Mc. and Y is the dimension of the cavity in question. Thus: What will be the resonant frequency (f) of a cylindrical cavity of 3/4″ diameter? From the table, it is seen that a cylindrical cavity is 9.05 inches in diameter at 1000 megacycles. Therefore f = 1000 (9.05/0.75) = 1000(12.066) = 12,066 Mc.

The following convenient formulae are given for the benefit of the reader

who desires to make direct calculations for purposes of his own:

SQUARE PRISM

(1) a (inches) $= 8347.2/f_{Mc}$

SPHERE

(2) b (inches) $= 10,360/f_{Mc}$

CYLINDER OF CIRCULAR CROSS SECTION

(3) c (inches) $= 9050.6/f_{Mc}$

When it is desired to convert the dimensions given in the accompanying tables into centimeters (as, for example, when comparing these dimensions with similar tables and data in other engineering papers and texts), multiply the listings in columns 2, 3, 4, or 5 by 2.54.
AEROVOX PRODUCTS ARE BUILT BETTER

CAVITY RESONATOR DIMENSIONS

1000-30,000-Mc, RANGE
● For Fundamental Mode

FREQUENCY (Mc.)	WAVELENGTH (cm.)	DIMENSION A (inches)	DIMENSION B (inches)	DIMENSION C (inches)
1000	30.00	8.35	10.36	9.05
1500	20.00	5.56	6.90	6.03
2000	15.00	4.17	5.18	4.52

Millions
now in daily use...

● Yes, MILLIONS of electric refrigerators, not to mention oil burners and other fractional-horsepower electric appliances with capacitor-type motors, are equipped with Aerovox capacitors ● Aerovox pioneered the high-capacitance electrolytic capacitor for motor-starting. Working in closest collaboration with motor designers and manufacturers, Aerovox produced the major portion of all such capacitors in daily use. And Aerovox is maintaining the outstanding selection of replacement capacitors whereby those capacitor-type motor sare kept going in postwar America ● Electrolytics are but one of many major types of capacitors developed and produced by Aerovox. Available now are Aerovox oil-filled capacitor types for your power-factor correction job. Likewise with mica, paper and other Aerovox types — these are coming through in tremendous quantities. Just keep *Aerovox* in mind.
