ICOM HF

Two Great Systems to Meet Your HF Needs

IC-720A. ICOM's Top of the Line HF System.

IC-720A. ICOM's full featured HF Xcvr...with top of the line features:

- 9 band Tx/Rx (all new WARC bands included) 160 - 10 meters broadbanded.
- General coverage receiver...0.1 to 30MHz continuous tuning.
- Passband tuning built-in standard.
- Digital display of mode/VFO and frequency.
- 200 watt PEP input...all solidstate.

- Automatically bandswitches IC-2KL/AH1.
- 2 VFO's built-in standard.

IC-2KL. Broadband solidstate linear automatically bandswitched by the IC-720A, IC-730 (w/optional LDA unit), or IC-701...1000 watt PEP input...compact, no tuning required.

ICOM Phone Patch. Works directly with IC-701, IC-720A or IC-730...FCC certified.

IC-730. ICOM's Portable/Affordable System.

IC-730. ICOM's Affordable Portable HF Xcvr. Ideal for mobile/portable use with features found in no other unit in such a compact size:

- 8 bands Tx/Rx 80 - 10 meters broadbanded.
- IF shift standard/passband tuning optional.
- 200 watt PEP input...all solidstate.
- 2 VFO's built-in standard.

- Memories...one frequency per band.
- Compact size...only 3.7 in(H) x 9.5 in(W) x 10.8 in(D)

IC-AH1. 5 band automatic bandswitching mobile antenna for use with IC-720A, IC-701, or IC-730 (w/optional LDA unit).

IC-SP3 - External Speaker

IC-730 - 8 Band Mobile Base Xcvr

IC-AH1 - Automatic Bandswitching HF Mobile Antenna

ICOM

2112-116th Avenue NE, Bellevue WA 98004 / 3331 Towerwood Dr., Suite 307, Dallas, TX 75234

All stated specifications are approximate and subject to change without notice or obligation. All ICOM radios significantly exceed FCC regulations limiting spurious emissions.

Preamplifiers

The famous Palomar Engineers preamplifier has been updated and packaged in an attractive new cabinet.

For the SWL there is the P-305 (9-v DC powered) and the P-308 (115-v AC powered) featuring full shortwave coverage, selection of two antennas, 20 db attenuator, 15 db gain control and on-off-bypass switch.

For transceivers, the P-310X (115-v AC powered) and the P-312X (12-v DC powered) feature automatic bypass on transmit, adjustable delay for return to receive, and 350 watt transmit capability.

All models have these features:

- Up to 20 db gain.
- Covers 1.8 to 54 MHz in four bands.
- Low noise figure.
- Reduces image and spurious response.
- 8" x 5" x 3". Brushed aluminum control panel. Black vinyl cover.
- SO-239 connectors.
- LED pilot.

Order direct or from your favorite dealer. Model P-305 Receiver Preamplifier for 9-v DC \$99.95. Model P-308 for 115-v AC \$109.95. Transceiver Preamplifier Model P-310X \$129.95. Model P-312X \$129.95. Add \$3 shipping/handling. Calif. residents add sales tax.

Don't wait any longer to pull out weak, rare DX.

W2NSD/1 NEVER SAY DIE

editorial by Wayne Green

But what about the governments, you ask? Why aren't they spending more money on schools? It's obvious to us that the way out of many of the problems they have in these third-world countries requires education...and that, even with a good education available, it is going to take several generations before things are able to change significantly.

You have to understand that in a country where there are very few educated people, you have a special political problem. The head of the country, whether he is a king, president, or dictator, stays in power by virtue of his taking care of those who are supporting him. He, and they, are primarily involved in two pursuits...staying in power and getting all that they can from the situation. Thus there is little interest or money available for long-range projects such as education.

When do-good organizations or countries can be talked into sending money for projects, the money goes almost entirely to the politicians, not to the people. These governments laugh at the countries which are suckered into sending money...all the while asking for more and more.

Countries such as Jordan, where the king takes a real interest in his people and invests money and time in their education, are few. The instability of the other countries makes it impractical for their leaders to invest in anything but their own short-term enrichment.

Thus it is going to be almost impossible to get much in the way of official encouragement when it comes to developing amateur radio in most of the third-world countries. The visiting amateur can keep an eye out for those few children of the elite who might benefit from exposure to the hobby and try to get them started. They at least will have the possibility of getting enough education to be able to grasp the basics. And they have the opportunity to go abroad and further their education. The more you can get to some of these kids, the better shape amateur radio will be in in that country. This will eventually be reflected at conferences in Geneva.

Remember, too, that these kids may grow up to be the leaders of the country in ten years or

ENERGIZER...OR NICAD?

If you are anything like me, you keep buying these new electronic toys which are coming on the market. Since most of them require batteries to run, you probably are also buying up a storm of AA batteries. My flash units use 'em. My portable stereo recorders use 'em. My Sony Walkman uses 'em. My Sony Typecorder uses 'em.

The next question is this: What type of battery should you get? It is positively bewildering to go into my friendly radio store and see a wide assortment of batteries facing me. There are heavy-duty batteries, long-life batteries, energy cells, and so on. I'm sure that you, too, have faced this problem and wondered what to do. Unfortunately, the tendency is to sucker in and go for the most expensive battery, figuring you usually do better if you go first class...after all, it's only a few cents extra to go first class.

Salvation is here, so pay attention. The answer to the problem may not be what you think. The fact is that once I made a study of the situation I was amazed to find that I had been blowing a good deal of money on the wrong batteries.

The best bargains of all, probably not surprising to you, are the nicads. These are the most expensive, but if you keep 'em charged your cost per hour of use will eventually be the lowest. If you are going to buy anything except a nicad for regular use you will do best to buy the cheapest battery you can. Sure, some of the high-priced batteries will last almost twice as long...but they will also cost four times as much. That's no bargain.

A WORD FOR DX OPS

The ham who is living in a third-world country has a special responsibility both to amateur radio and to the country. In the long run, amateur radio will grow as a result of the development of local amateurs rather than having to depend entirely on visitors.

In many of the countries I have visited, the hams have taken this seriously but have been frustrated at almost every turn...particularly in Africa. When you start out with most of the population having a very low level of education together with extreme poverty, your possibilities are immediately limited to a handful of the wealthier people. In most of the countries, the kids have to be sent outside the country if they are going to get much of a high school educa-

tion...the age when amateur radio is most likely to take hold...so you really can't do a lot within the country.

What is the motive for a teenager in a small African country to go to the trouble to learn about electricity, radio, and electronics so he can talk with middle- and older-aged white hams around the world? Only a tiny percentage could ever hope to own a station...and for what? His peers would put him down and there would rarely be enough interest for a club to get started.

Some of the kids have school available, but the conditions are not exactly encouraging. There are few, if any, books, and teachers are poorly trained and paid. The classes are crowded, so little interest or enthusiasm is developed for continuing the experience.

WARC-BAND BEACON

The 10-, 18-, and 24-MHz bands, allocated to amateur radio by the 1979 World Administrative Radio Conference (WARC), are not yet available to US amateurs for general use. However, experimental station KK2JXM, licensed to W4MB, transmits on these bands every Friday, Saturday, and Sunday. Since most newer transceivers are equipped to receive the new bands, many amateurs have the capability to monitor the KK2JXM beacon and learn about propagation at these frequencies.

KK2JXM begins its transmissions at 0000 UTC every Friday, continuing through 2400 UTC Sunday. During the last two weekends in April and the first two weekends in May, all transmissions will be made on whichever of the three bands provides the best propagation to Europe. The last two weekends of May and the first two of June will find the emphasis on South America. Again, the band selected will be the one offering the best signal into the target area.

The frequencies used for these experiments are 10.140, 18.108, and 24.930 MHz, with an effective radiated power (erp) of 30 Watts. The frequencies may change without notice. To QSL or to obtain further information, contact R. P. Haviland W4MB, 2100 S. Nova Road, Box 45, Daytona Beach FL 32019.

BONUS BUCKS

This KENWOOD BONUS BUCKS coupon, when presented to any factory authorized dealer in TRIO-KENWOOD COMMUNICATIONS products, may be used as partial payment in the amount of \$30.00 toward the purchase of any new KENWOOD model R-1000, TR-8400, or TR-7730 with MC-46 or basic UP/DOWN microphone, or may be used as partial payment in the amount of \$15.00 toward the purchase of any new KENWOOD model TS-130S, TS-130SE, or TS-530S amateur radio product. The purchase must be made during the period March 1, through June 15, 1982. The customer must present a separate coupon (one only) for each of the listed models being purchased. Additional coupons are available from our authorized dealers. TRIO-KENWOOD assumes no responsibility for the inability of any of its dealers or of itself to deliver any specific product within the period specified in the foregoing. Offer valid only in the U.S.A. Void where taxed or prohibited by law. Resellers are not eligible to participate in this program. This coupon is a part of TRIO-KENWOOD COMMUNICATIONS "BONUS BUCKS" sales program. It has no value unless submitted in compliance with the rules of that program prior to June 15, 1982.

so. Perhaps in another generation it will be possible to do more with amateur radio. There are some hints at better and cheaper educational systems which could eventually benefit these small, poor countries, making it possible for kids to surmount the terrible conditions under which they are living. With amateur-radio-oriented leaders, who knows?

BLITZ CODE LEARNING

Letters from readers indicate that it has been a while since I've written about Morse code. I guess I should have thought about that, because when I talk at hamfests I find that most of those present are not really aware of what is involved with learning the code. Some myths have developed which need explaining.

The historical system for teaching the code is to start people off with the individual characters, teaching them the dot and dash equivalents of each letter, number, and punctuation mark. Then the code is sent very slowly and people try to remember the appropriate under which they are living. With amateur-radio-oriented leaders, who knows?

This process is speeded up gradually until one reaches a plateau, where the increase in copying speed suddenly stops...often for a long and discouraging period of time. This is when we lose an estimated 90% of our prospective hams. At around ten words per minute, one finds that the brain no longer will work fast enough to hear the sound, translate it into dots and dashes, look the com-

bination up in a table in the mind, and write it down.

This plateau holds fast until the person develops a completely new way of translating the code. With some people, this is not difficult. With others, it is virtually impossible. The system which permits the breaking of the plateau has to do with hearing the code groups as sound patterns and having them translated into writing or typing on the subconscious level. If you have to think, you can't really copy code.

Modern brain research shows us that the plateau results from the limitations on brain speed in shifting information from the left to the right part of the brain...and back. We get up

The ultimate team... the new Drake "Twins"

The **TR7A** and **R7A**
offer performance and versatility
for those who demand the ultimate!

TR7A Transceiver

- **CONTINUOUS FREQUENCY COVERAGE** — 1.5 to 30 MHz full receive coverage. The optional AUX7 provides 0 to 1.5 MHz receive plus transmit coverage of 1.8 to 30 MHz. for future Amateur bands, MARS, Embassy, Government or Commercial frequencies (proper authorization required).
- **Full Passband Tuning (PBT)** enhances use of high rejection 8-pole crystal filters.
- New!** Both 2.3 kHz ssb and 500 Hz cw crystal filters, and 9 kHz a-m selectivity are standard, plus provisions for two additional filters. These 8-pole crystal filters in conjunction with careful mechanical/electrical design result in realizable ultimate rejection in excess of 100 dB.
- New!** The very effective NB7 Noise Blanker is now standard.
- New!** Built in lightning protection avoids damage to solid-state components from lightning induced transients.
- New!** Mic audio available on rear panel to facilitate phone patch connection.
- **State-of-the-art** design combining solid-state PA, up-conversion, high-level double balanced 1st mixer and frequency synthesis provided a no tune-up, broadband, high dynamic range transceiver.

R7A Receiver

- **CONTINUOUS NO COMPROMISE** 0 to 30 MHz frequency coverage.
- **Full passband tuning (PBT).**
- New!** NB7A Noise Blanker supplied as standard.
- **State-of-the-Art** features of the TR7A, plus added flexibility with a low noise 10 dB rf amplifier.
- New!** Standard ultimate selectivity choices include the supplied 2.3 kHz ssb and 500 Hz cw crystal filters, and 9 kHz a-m selectivity. Capability for three accessory crystal filters plus the two supplied, including 300 Hz, 1.8 kHz, 4 kHz, and 6 kHz. The 4 kHz filter, when used with the R7A's Synchro-Phase a-m detector, provides a-m reception with greater frequency response within a narrower bandwidth than conventional a-m detection, and sideband selection to minimize interference potential.
- **Front panel pushbutton control** of rf preamp, a-m/ssb detector, speaker ON/OFF switch, i-f notch filter, reference-derived calibrator signal, three agc release times (plus AGC OFF), integral 150 MHz frequency counter/digital readout for external use, and Receiver Incremental Tuning (RIT).

The "Twins" System

• **FREQUENCY FLEXIBILITY.** The TR7A/R7A combination offers the operator, particularly the DX'er or Contester, frequency control agility not available in any other system. The "Twins" offer the only system capable of no-compromise DSR (Dual Simultaneous Receive). Most transceivers allow some external receiver control, but the "Twins" provide instant transfer of transmit frequency control to the R7A VFO. The operator can listen to either or both receiver's audio, and instantly determine his transmitting frequency by

appropriate use of the TR7A's RCT control (Receiver Controlled Transmit). DSR is implemented by mixing the two audio signals in the R7A

• **ALTERNATE ANTENNA CAPABILITY.** The R7A's Antenna Power Splitter enhances the DSR feature by allowing the use of an additional antenna (ALTERNATE) besides the MAIN antenna connected to the TR7A (the transmitting antenna). All possible splits between the two antennas and the two system receivers are possible.

Specifications, availability and prices subject to change without notice or obligation.

See your Drake dealer or write
for additional information.

COMING SOON: New RV75 Synthesized VFO
Compatible with TR5 and 7-Line Xcvrs/Rcvrs

- Frequency Synthesized for crystal-controlled stability
- VRTO (Variable Rate Tuning Oscillator*) adjusts tuning rate as function of tuning speed.
- Resolution to 10 Hz
- Three programmable fixed frequencies for MARS, etc.
- Split or Transceive operation with main transceiver PTO or RV75

New Drake TR5 Transceiver

far above average!

COMING SOON:
RV75 Synthesized VFO
featuring the Drake "VRTO"

- Frequency Synthesized for crystal-controlled stability
- VRTO (Variable Rate Tuning Oscillator*) adjusts tuning rate as function of tuning speed.
- Resolution to 10 Hz
- Three programmable fixed frequencies for MARS, etc.
- Split or Transceiver operation with main transceiver PTO or RV75

* Patent pending

With the new TR5 versatility and value are spelled D-R-A-K-E...

DYNAMIC RANGE

The dynamic range of the TR5 is unexcelled by any transceiver in its class. The TR5's greater than 0 dBm third order intercept point (85 dB two-tone dynamic range) at 20 kHz spacing can be achieved only by the use of a passive diode-ring double balanced mixer. Drake was the first to bring this technology to the Amateur market with a high-level mixer in the TR7.

RELIABLE SERVICE

When you purchase a TR5, or any Drake product, you acquire a product of the latest production techniques, which provide reliable performance. Yet with a product as sophisticated as one of today's transceivers, after-sales service is a must. Ask any Drake owner. Our Customer Service Department has a reputation second to none.

ACCESSORIES

Drake is the only Amateur Radio manufacturer who offers a full complement of accessories to satisfy almost every desire the HF Amateur may have. This wide selection allows any operator to assemble a station which meets his needs, and assures compatible interfacing and styling instead of a desk full of equipment with a variety of styling and poor operation as a system.

KILOWATT AMPLIFIER

Everyone wants to be heard! The accessory L75 and its 3-500Z (1200 watts PEP input) and a decent antenna will do the trick. This rugged self-contained amplifier/power supply will put the TR5 on an even footing with the best of them.

ENGINEERING

The TR5 and all Drake Transceivers, are backed by the best in engineering. The TR5 is the result of an extensive engineering effort, combining proven past techniques and ideas with new state of the art concepts.

As a result, the TR5 will not be superseded by a new model every six months. It represents a true radio communications value that will provide many years of operating enjoyment.

Pacific Odyssey

— the Kingman/Palmyra adventure

Kingman; Palmyra. For most hams, these are names which simply mean two new countries, new callsigns, necessary on the road to the DXCC Honor Roll. But to me, Kingman/Palmyra means the most physically demanding and mentally trying of all the DXpeditions I've ever

taken part in. Located nearly one thousand miles south of the Hawaiian Islands, these uninhabited coral islets are among the most remote and difficult places to get to in the world.

Born out of a rag-chew session between Harry Mead VK2BJL and myself while my ship, the sailing

yacht *Banyandah*, was en route to Japan early in 1980, Kingman/Palmyra (K/P) was to be just one of many DX locations planned in a grand transpacific DXpedition spree for 1981. Originally, Harry (of Mellish VK9ZR and Spratly 1S1DX fame) was to organize operators, licenses, and finan-

cial backing for a series of DXpeditions through the Pacific. Locations would include Kingman/Palmyra, Samoa, Tokelau, Kermadec, and a grand finale back where it all began, Mellish Reef.

During numerous rag-chew sessions spanning most of 1980, our plans

The ultimate Field Day site? AD0S/KH5/K.

solidified; *Banyandah* was to sail to Hawaii early in 1981, outfit herself with complete base-camp equipment, and be ready for the first group of operators by spring. Unfortunately, Harry's time to organize such a massive undertaking diminished as his electronic repair business in Sydney grew, and by late 1980 it became obvious that he would not be able to help on the first leg of this epic adventure.

At that time, the thirty-eight foot *Banyandah* was in the mid-north Pacific, battling heavy seas and gale-force winds on an early-winter crossing from Japan to Hawaii. It appeared that K/P would be an all-American operation, so I turned to my good friend, Karl Jensen KJ7B, in Seattle for help. With his usual efficiency, Karl put the word out through all the DX clubs and bulletins while spreading it across the airwaves. The initial response for the three operators needed was terrific; within a week he had a two-page list of potential candidates. But these glad tidings were short-lived; after the full requirements were explained to each candidate, all but two dropped out. To some, the three-thousand-dollar financial commitment was too steep (although as full-scale DXpeditions go, it was cheap). But to all, the real problem lay in the enormous time required to complete the two operations and make the 2,300-mile voyage. Not many people can afford thirty-five to forty days away from family or employer.

Upon our arrival in Honolulu in early December, we still had only two operators willing to challenge K/P. One, the eventual DX King of Kingman, was a quiet, family man from Minnesota. George Carleton AD0S had a burning desire to try his hand at big-

time DXing. In our chats, enthusiasm seemed to ooze from his every rf wave. He was a social worker at one of the state hospitals back in Bremer, Minnesota. A plodder, a converted CB operator, he took to the challenge of DXing like a big gun from W6-land. George and his friends outgrew the local radio club when they met resistance for more DX activities. They formed their own club, the Paul Bunyan Wireless Association, immediately entered every club contest around, and offered night courses for future hams.

George and I were so diametrically opposite in backgrounds that we immediately formed a fast friendship. While I've always been a globe-traveling gypsy, working and living in almost every part of the world, George had never left his native mid-America. He married his childhood sweetheart, stuck with his original employment, and carved a homestead out of thirty acres of rural forested land.

The other operator, the third corner of the triangle, was a fine and proven contest operator from California. Kingman was his dream and an allband operation his goal. More about him later.

As the New Year rolled in, *Banyandah* lay under the highrises at Waikiki and we still had four months of preparations before us. A daily planning session was set up on 15m, with Karl KJ7B acting as the group's central coordinator. Tasks were assigned, with one operator to solicit equipment from manufacturers, the other to solicit financial aid and sponsors. My wife, Judith, and I started the laborious chore of purchasing the numerous supplies and modifying our ship to hold them.

For the base camp, we purchased two large Coleman tents, three folding

From left to right: George AD0S, Judith Binder, the author, and Bill W6HTH, aboard the S.Y. *Banyandah* before departing for Kingman.

tables and chairs, a propane cooker, pots and pans, dishes, water containers, sleeping bags and air mattresses, flashlights and internal lighting, all with spares and backups. In other words, our list included everything necessary to exist on a bare pile of shells in the middle of the ocean. On the critical power plant side, we chose the best: two Onan 2.5-kW portable gasoline generators modified especially with automatic oil feeders. They were expensive, but they came with built-in fuel pump, oil pressure pump, and a robust cast-iron engine. A selection of spares also was taken so that any breakdown could be remedied, including a broken crank rod. Hundreds of other items also were loaded aboard for the

base camp: large-capacity plastic fuel drums, funnels, fuel transfer pumps, separate power leads for each station, and home-made twenty-seven foot push-up towers with four-foot long stainless steel anchoring stakes.

And let's not forget the food. Case after case came aboard as Judith returned from her forays into Honolulu's markets. Can you imagine the quantity and variety necessary to feed five adults plus our two children for five weeks without a supermarket in sight for a thousand miles?

On the electronics side, matters were not progressing as smoothly. Manufacturers' budgets were getting tighter and tighter. In the past, outright donations

Go to Hawaii and take a left—Kingman is the first atoll on your right.

Bill W6HTH/KH6 and the author's sons, Jason and Jerome, relax in the Pacific sunshine.

could have been expected—or at least the loan of equipment—but this year all the major equipment producers were willing only to sell their goods at dealer cost. We were still short the third operator, and hence money was tight. George suggested that he buy one Wilson tribander, the System 33 with 40m add-on on the condition that the next group, the ZM7 group, purchase a similar beam; then both groups could share them. For a third antenna, one for low-band operation, George would bring his DenTron doublet. By March, all equipment except the transceivers was either on board or en route.

As one equipment manufacturer after another refused our requests for the loan of equipment, George offered to break down his home station and send it along with borrowed equipment from his newly-formed club. A generous offer; after all, anything can happen to sensitive gear carted halfway around the world by airplane, sailing yacht, and dingy. Not to mention the hazards of operating it in an exposed salt-laden environment under the rigors of portable power. But equipment was needed, or we wouldn't be going anywhere.

One night George started thinking about how this ex-

pedition was shaping up to be an all-American DXpedition. We had Onan generators, Coleman tents, Wilson antennas, and American operators—and Kingman/Palmyra is American. The light must have blinked on in his brain, for early the next morning he contacted the Ten-Tec Corporation in Tennessee and put forth his request. At last we had found a manufacturer eager to help, for they offered the outright loan of three complete stations with power supplies and outboard vfos in their Omni-C range. Like a runner clearing the final hurdle, we all let out a collective sigh of relief. A departure date was set, air travel tickets were purchased, and *Banyandah* loaded aboard the last supplies: gasoline, diesel fuel, and engine oil.

We were now a going concern. Permissions had been granted and every bit of gear had been arranged, but we still had only two financial members, neither of whom could afford a red cent more. As a last ditch effort, an alternate financial arrangement was offered: *Banyandah* would chip in the remaining third share on the proviso that the boat be paid back first from any forthcoming contributions. This was applauded as an excellent solution and was readily ac-

cepted by the other two members.

I must admit that I was not as enthusiastic about it as the others since our past DXpeditions had always been straight-out charters. But my wife and I are avid adventurers who get personal satisfaction in overcoming obstacles—and we're a little DX-mad to boot. We had a sincere desire to see the K/P duo reactivated. Besides, we firmly believed that the amateurs of the world would support our expedition—a mistaken belief which proved costly.

All went well for several weeks; George chopped extra wood to warm his house in his absence, the other operator cleared his desk, and we took a much needed rest with our two young sons—for we had been on the go since our grueling, forty-five-day crossing of the north Pacific.

When the disaster struck, it fell like a meteorite from the heavens. Our California operator dropped out when there were only two weeks to go before departure. Great! Thousands of dollars and hundreds of hours of labor and planning down the drain since two men cannot set up DX stations at a place as dangerous and physically difficult as Kingman, nor can they

operate and survive with one man ashore and the other minding the boat.

We definitely had a serious problem! George's reaction was as I expected: "We'll do it alone!" His faith was like an injection of adrenaline into my waning spirit. But in the end it was a Honolulu amateur who came to our rescue. Bill Boykin W6HTH/KH6 already had stood by us during the hectic preparations in Honolulu. He had helped coordinate and track down equipment; he had run errands and loaned us his car for the months that it all took.

Bill, a retired old salt from the Navy, is an ex-electronics technician who had been stationed in many a foreign port. He was not the typical DX hound since his true love was six meters. But as each new item was stored aboard, I could see the dream germinate and grow in his eyes: a long sea voyage across the balmy trade winds to a wild and rarely visited patch of land, the excitement of setting up the beams and stations, and, the topper, his six-meter beam proudly atop the tallest tower! Time wasn't his problem, but money was. He could not offer any financial support, so instead he readily volunteered his time, muscles,

**“all other gear gave us trouble...
the TEN-TECs just kept working great.”**

**1981-82
Trans Pacific DX Expedition
used TEN-TEC OMNI-C transceivers.**

**KINGMAN REEF, PALMYRA, TOKELAU —
33,000 contacts without a miss.**

As George Carleton (AD0S ex KH5K) said in a letter to TEN-TEC... "12,100 QSO's from Kingman, 8100 for me, 3100 in the first sitting with the rig on a continuous 33 hours except for 2 minute gas breaks... all other gear gave us trouble due to salt spray — the TEN-TECs just kept working great.

"This is the most QSO's ever from Kingman and all were barefoot. A few times generators ran out of gas during rainstorms with rigs operating on TX... no problem with voltage drop, and no damage. No tuners were used... only your rigs and (antennas). The wind blew continuously from 20 knots to 50-60 knots and we literally had to open the tent to let the rain out, salt water and spray everywhere, watches quit, keyers and linear (other brands) quit after the first QSO — arcing due to salt spray, but the TEN-TECs never even got warm when the tent was around 100°F.

"... American gear is best."

The TEN-TEC OMNI-Cs went on to serve on Palmyra and Tokelau with equally impressive results and we thank the group for their letters—we couldn't have said it better.

**See your TEN-TEC dealer
for the great All-American
transceiver — TEN-TEC OMNI-C.**

The spectacular performance of the TEN-TEC OMNI-C results from these fine features:

- 9 hf bands • Total solid state—from the pioneer • Broadband—from the pioneer • 3-mode, 2-range offset tuning—receiver, transmitter or transceiver • Optimized receiver sensitivity • Greater dynamic range • Optimized bandwidth—seven response curves—up to 16 poles of filtering • Notch filter • Noise blanker • "Hang" agc for smoother operation • Full or semi break-in (QSK) • WWV reception on 10 MHz band • Digital readout • Separate receive antenna input • Automatically switched S/SWR meter • 200 watts input all bands • VOX and PTT • Phone patch jacks • Zero-beat switch • Adjustable volume and pitch sidetone • Adjustable threshold ALC • Front panel band switch also controls linear or antenna • Automatic sideband selection • Super audio quality—less than 2% THD • Impeccable signal—exceeds FCC requirements • High stability—less than 15 cycles change per degree F temp. change • High articulation keying—set to 3 msec. rise and decay time • Compression loaded speaker • Plug-in circuit boards • Operates on 12-14 V dc mobile, 115/230 V ac with external supply • Made in U.S.A. by pioneers in solid state amateur radio—TEN-TEC.

TEN-TEC, INC.
SEVIERVILLE, TENNESSEE 37862

The "country" of Kingman is about seventy-five yards long and towers five feet above sea level in calm weather.

Accommodations on Kingman Reef were anything but luxurious, but George and Bill didn't seem to mind.

and skills, and replaced our California operator.

With that I faced another difficult decision: *Banyandah* lay at the dockside fully equipped and ready to go; our dollars and hours of labor had already been expended, but financially we were in a mess. What should I do? Our now-dropped-out operator was to have arranged sponsors, and now there was no time. I had had no experience with the returns from QSL cards but believed (like so many) that a green stamp per envelope was the minimum to be expected. Well, if that was the case, we'd just have to work that many more stations.

The night of April 7th was cool and clear; the twin volcanic peaks of Mauna Loa and Mauna Kea stood behind us, finely etched by the intense curtain of starlight. At their base, where the sea greets these giants, lay the tiny pleasure-boat harbor of Honakahou, carved out of a solid river of lava. *Banyandah* lay at dockside like a fine race horse waiting in the gates. A child-like atmosphere of excitement and anticipation prevailed as the last baskets of papayas, pineapples, and stalks of bananas were lashed into place. A final tug on the ropes securing the drums of gasoline, and everything was secure. The

ship's diesel engine was started, roaring into life and shattering the quiet loneliness of the basin. George and Bill dropped the mooring lines and, amid the shouts of "Bon Voyage!", "Safe journey!", and "Good DXing!", *Banyandah* glided smoothly away.

Sweet, cool air was the first hint of the trade winds. Each gust was a bit stronger, and when *Banyandah's* lee rail dipped, the engine was secured. Finally, it was time to relax. The boat's automatic wind-steering device was holding a true course south while the lights of Hawaii's Kona Coast diminished astern. At last we were under way, severed from civilization. The memory of the months of toil and frustration seemed to melt with the miles passing under our keel.

The smooth, fast movement of the boat, the black sky bright with stars, and the sea glowing with amazing bits of bioluminescence created a mood so perfect, a mood which lasted the entire voyage, that success could be tasted in the air. We chatted the night away, George and Bill both refusing sleep for fear of losing the magic of the moment. Judith, the more practical one, helped our children (Jason and Jerome) get to

bed and then brewed a fresh pot of coffee for the night watch before turning in. Our normal routine was to split the long night hours into two watches, dusk to midnight and midnight to dawn. During the daylight hours, watches were more relaxed as the world's commercial shipping has a better chance of seeing our tiny craft.

At daybreak, Ka Lae, the most southern point of the United States, could just be seen through the haze, while the ship's log held steady at six and a half knots. By 1000 hours, we had our last sight of land and we were completely alone, a white dot at the center of a disk of blue.

Days merged into nights and back into day, each the same and yet somehow quite different. We had time to study each cloud, each wind swell; we had time to talk or to be alone with our private thoughts. We caught fish on our constantly trailing lure—mostly small bonito. But sometimes a powerful dolphin fish, a mahimahi, would strike and the battle would be on. This fine-tasting fish with its firm white flesh would battle with all its immense strength until at last it could be hauled aboard flapping and jumping, changing its body color

from yellow through green to an electric blue until death took it and it turned to silver.

Each noon, after my celestial sight, I would plot our position on the chart. Each day, the tiny dot marking our position would inch its way closer to the cross marked Kingman Reef as jumps of 136 miles, 138 miles, and, once, 144 miles were plotted. After seven full days of sailing, we were only fifty miles away from our goal. The week had been perfect: fifteen-knot northeast winds, sunny days, and starry nights. No ships, airplanes, or other man-made objects had been sighted.

Originally, we had set sail for, first, the palm-clad islands of Palmyra, and then Kingman, since finding that five-foot-high speck after a one-thousand-mile ocean voyage would require perfect conditions and the utmost skill. But Kingman was the real challenge. And by the halfway point, George had convinced me that it required a fresh and eager group to do it justice and should come first. I altered our course to make the attempt. But on that last evening, alone on watch, as the sky darkened with the approach of rain clouds, I began to doubt the wisdom of my choice.

Ocean currents are

strange forces. For thousands of miles they will remain constant, flowing in one direction at a reliable rate, but upon an approach to land, with the sea bottom suddenly rising, they become unpredictable. To make matters worse, somewhere in this area we would leave one current and enter the world's strangest current, the equatorial countercurrent. This narrow band of water defies all sense by moving directly opposite to the normal trade winds. Its northern limit shifts back and forth across the region at a whim of some unseen force, causing distress among all ship captains who sail this area. Normally, a very wide berth would be given to Kingman, but it was my job to find it safely.

Soon the wind freshened and swung ominously to the southeast. Rain began to fall. It increased until my vision was down to a scant fifty feet. But *Banyandah* heedlessly sailed on, blindly cutting through the water while closing the distance between us and one of this ocean's worst navigational hazards. As the miles ticked off, I held my breath and prayed that my instruments and sights were correct and that our luck would hold. Every few minutes I poked my head above the spray dodger and peered into the rain and gloom, expecting to see that flash of white signalling breakers and destruction.

By 0400 hours, I had had enough and dropped the headsail and mizzen. Quietly, the ship came into the wind, gently rocking in the swell. I woke Judith and crawled into the bunk. "Wake me if the stars show," I said, and immediately fell asleep.

Just before 0600, I was up again. The storm had passed and the first tinges of pink lit the eastern horizon. Quickly Judith and

George ADØS, making one of the 12,176 KH5/K QSOs.

I measured the angle between horizon and our favorite navigational stars, jotting down the exact time of each sight. My voice calling out "Mark!" at each sight must have woken George and Bill; sleep was still in their eyes when they crawled out of the stern cabin. George scanned the blank horizon and said with a grin, "No trees in sight yet." And we all laughed since this was the Minnesotan's usual way of greeting a new day at sea.

The star sights didn't take long to work out and showed that we were still thirty miles from that danger which had seemed so near in the rain and the dark. The current had worked its magic and had pushed us away instead of closer. The wind had gone with the passing rain, leaving a calm sea and a bright

hot day. Now under power, we continued on a new heading. A scum line was passed—a convergence of currents trapping bits of floating plastic and discarded light bulbs, all alive with small crabs and tiny fish. All morning I tracked the sun with my sextant, and my chart became a mess of intersecting position lines, each a bit closer. By the time the sun reached its azimuth we were very close, and conditions were perfect for a landing.

At 1300 hours I climbed our forty-five-foot mast and scanned the horizon. The sea was flat and calm, the horizon sharp but empty. At 1400, with (supposedly) only six miles to go, I climbed again. There! Just near the edge of the world a vague splash of white showed for a moment and I couldn't believe my luck.

The breakers of Kingman Reef were in sight! At deck level, the rest of the crew jumped up and ran to the rail, but nothing could be seen. For the next hour they strained for their first glimpse. Finally, with only two miles to go, George let out a whoop of delight. The rest happened fast. One moment a flat sea, the next a long line of small breakers off our beam and the sea changed from deep blue to aquamarine. Coral heads seemed to rush up to meet us. As we crossed the sunken reef, they were plainly visible even though the depth meter recorded seventy-five feet.

Portable KH5/K first appeared as a heap of brilliant yellow-white sand, sterile and completely devoid of vegetation. The ridge of fine coral rubble and up-turned coral boulders was the result of thousands, maybe millions, of years of the sea crashing against the outer barrier reef and washing the broken bits of coral and dead shells into a pile. Excitement ran high as we toured the area in the lee of the cay, taking soundings for anchoring.

It was then that we met the first evidence of Kingman's wildness. Although the depth recorder showed a steady bottom, it was over two hundred feet down! And it was all the same, right up to the perpendicular cliff of reef. At a quarter mile off, I said a silent prayer and lowered the anchor down into the blue, paying out every inch of warp, shaking my head as it slithered over the bow rollers and disappeared from sight.

The cay seemed to grow smaller instead of bigger as we approached in our ten-foot aluminum dingy. Soon it could be seen that its side was steep and not the long gentle slope we had first seen. Kingman was not smooth sand but an im-

Land ho! The good ship Banyandah makes for a landfall on Palmyra.

The base of operations on Palmyra was the green building at the center of this idyllic scene.

mense pile of six-inch-wide clam shells bleached white by the intense tropical sun. By crawling on all fours we reached the summit, and my heart sank even further when I realized that this forsaken pile of shells went hardly six feet across at the top before tumbling down again into the sea.

We walked the full length of the cay—all seventy-five yards of it. Decomposed bits of wire and the remains of a vertical's base marked the spot of the last DXpedition, probably Kingman's last human visitors. On the northwest end, nature had scalloped out a hollow with a flat area about ten feet square, backed by a near-vertical wall of shells and large coral rock. It looked tailor-made for the smaller of our two tents. Its only threat was the water, which lay only two feet away. Was this high or low tide? A quick look at the debris line indicated that it was nearly high. I mentioned that the hollow might be swept by swells if the sea got nasty. George's only comment was that he didn't mind getting his feet wet as long as he stayed on the air. And so the smaller tent was set up there—a move which later proved to be a key to our success.

Tropical night comes quickly, and the fiery reds

and oranges of twilight are short-lived. Soon it became impossible, even dangerous, to carry on in the half-light, and reluctantly we returned to *Banyandah*. Once "home," Judith prepared a celebration landfall and birthday dinner, for we just happened to land on her birthday, April 15th. A special dining table was set up in the cockpit and all our "at anchor" crockery was laid out. That night we rode a wave of euphoria.

At dawn the next morning, the boat came alive as we began the back-breaking job of hauling equipment ashore. Each item was unloaded into one of three piles: power, tent, or antenna. By mid-morning the bulk of it was there, and Bill and George started assembling the beams while I lugged generator supplies to the top of the ridge and established the power plant. For a while, Jason and Jerome ran little errands, but boredom set in and they disappeared down the cay, running from one pile of flotsam to another, beachcombing the most untouched beach in the world.

They returned dragging a large pink fishing float and a long barnacle-encrusted length of bamboo. Thirty minutes later Old Glory was raised, fluttering proudly from its bamboo

staff supported at the surf line by a pile of dead coral boulders. Little did we know that storms were to snap that staff like a match stick three times before we left!

Noon was approaching, and the day was becoming alarmingly hot and airless. Worst of all, our ankles started to swell and turn black and blue from numerous painful jabs from the saucer-shaped shells. We cautioned each other about heat exhaustion, but DX fever was growing inside of us. The tribander with the 40m add-on was put right out in the low-tide area of the reef. The other tower held both a tribander and the six-meter beam. Raising it was a hellish job, and several moments of near-disaster passed before the guys were finally secured. The rest went much like any Field Day back home. The two stations were set up, coax and power connections were made, and the beams were checked for swr. Everything looked fine; Kingman was ready.

At 0057Z April 17, George made the first contact using the call sign AD0S/KH5/K. A huge grin spread across his face as he spoke on 15 meters with his life-long friend Mike AF0T, back in Bremer, Minnesota. Mike surely deserved that first contact. He was an un-

seen member of our team whose cheerful encouragement and traffic patches eased the loneliness of the thousands of miles.

After Mike it was first come, first served. Immediately the pileup swelled into a gigantic opening day beast, and George's eyes bulged with the onslaught of decibels. The last Kingman group had not lasted long, and no one was going to miss this chance. George lit a fresh cigarette, let out a deep sigh, and called, "QRZ, Kingman Reef calling."

We had never planned our on-shore operation. In the first place, plans and schedules seldom work out when you are at a really rare and hard-to-get place. All we knew was that George was to be the king DXer. It was obvious; Bill had never beat his way through a pileup before and had come along to help set up. And although I had been on several really big DXpeditions, I had always been too busy running supplies, maintaining equipment, and minding the boat to do much operating.

Undoubtedly George was a novice, the new boy, the country operator, but he had a desire so indomitable that I knew nothing would stop him—and nothing did. After those first few moments of hesita-

Hustler Tribander 3-TBA

The Rugged, Reliable 10, 15, and 20-Meter Yagi You've Been Waiting for Is Now Available.

His exciting new tribander sets the pace for dependable performance with its two in one trap design — and the solid construction you've come to expect from Hustler. In fact, its durable design is partially based on concepts used in the time-tested and world-renowned Hustler 4-Band Trap Vertical.

The 3-TBA is the smallest full-featured tribander available today. It offers excellent front to back ratio and SWR at resonance. Plus, it is engineered to provide the widest possible bandwidths with superior power handling capacity.

A special heavy-duty saddle prevents mechanical distortion. Although light enough to ship UPS, and enable use of smaller, less expensive rotors, the 3-TBA can manage windloads up to 100 MPH! Its turning radius is only 14 feet.

All in all, you can't surpass the Hustler 3-TBA for top triband quality: Hustler — still the standard of performance.

For more information on this and other fine Hustler amateur radio products, contact:

An AMATEUR Company

Amid Palmyra's lush tropical vegetation, a tribander takes shape.

The operating position at AD05/KH5 with George and Bill hard at it.

tion, he sat in his chair making contact after contact nonstop, giving a new country to over three thousand stations before finally collapsing on the floor of the tent, ending forty-eight grueling hours without sleep. He awoke three hours later when I came ashore with fresh coffee, a hot meal, and a new supply of gasoline. A couple of hoarse comments passed between us, and after a sip of coffee and a new smoke, it was "CQ hello CQ," and he was back on the air, his breakfast untouched and growing cold beside the rig.

Yes, Kingman was a tough one. Tougher than Mellish or Spratly, and much harder than Palmyra or Tokelau. Not only was our foothold precarious, but the weather was always unpredictable, changing from sunshine and twenty-mph trade winds to storms which hit quickly after building for thousands of miles of open ocean.

The most frightening of these storms struck our first night ashore. The day had been quiet, but as the sun set, a breeze sprang up from the clear night sky. At first it was a cooling relief, but soon it began to build in jumps with gusts of thirty-five knots. As it increased, so did the tide until just at high water the horizon darkened with the advance of

brooding black thunderheads and the real storm began. The wind howled past gale force and the sea went crazy. Huge waves crashed over the barrier reef and pounded against our puny coral rock barricade. Salt-laden spume flew against the tent sides and was driven through by the torrent of rain. The inside of the tent was a horror scene. Gear was drenched and pools of water formed at our feet. At the storm's fullest fury, we were forced to bodily support the tent, and the harsh lighting showed our strain and fright as each man expected to be catapulted into the nearby lagoon by the next blast or breaker. Fortunately, the storm passed at dawn, and I hurriedly brought the larger tent ashore. Guy lines were doubled or tripled. Coral boulders were placed inside along the tent's periphery with an equal number around the outside to hold the tent in place.

Band conditions were fantastic with the big three always open to somewhere. The Ten-Tec Omni-C transceivers performed well, with such powerful barefoot signals that they controlled the pileups with ease. But that is not to say that we didn't have equipment problems. Bill had forgotten his earphones, and mine were so uncom-

fortable and tinny that we were forced to go without. George's Autek filter shorted out during the first night's storm, as did his new DenTron linear. He straightened out the Autek by changing a couple of the ICs, but the DenTron never even got looked at.

The biggest problem was the wash-over between the two stations. At first we thought it was insufficient grounding and ran extra wires into the sea. Then we blamed the broadness of the tribanders, but in the end we accepted it as a shortcoming in the transceivers. Most of the time it wasn't a problem, since George had priority with his skill at pulling callsigns out. At the worst times, it was terribly frustrating for Bill and me as we'd wait and then yell, "Go now! He's not transmitting!"

Considering that this was Kingman and one of the most difficult DX locations in the world, everything went amazingly well. All bands were covered except 160 meters, which was absolutely dead. Once again it was proven to me that the time used to search out the twenty-seven 80-meter and the ten 6-meter contacts would have been far better used to give many other stations the new country on the higher bands. More time was lost with incon-

siderate operators who grabbed two, three, and even four contacts on the same band and mode, stealing the contact from hundreds of others. Why can't all DX operators learn that expedition time is precious? Asking for QSL information and forced chit-chat during a pileup only breaks the stride of the operator. They could have listened a while for QSL and band-change information.

We also had the usual number of weirdos fanning their egos by whistling, mooing, and breathing heavily into the mike. Plus we had one particular crazy who obscenely attacked Bill and then George. It saddened and embarrassed us to hear such crude talk, and, as it happened, both my wife and children were listening, too!

On the brighter side, US operators proved the easiest to work as long as we worked each district fairly. JAs and European operators were frantic and sometimes unruly, while the South Americans politely got their share. And lastly, my cobbers from down under were still the same: callsign, name, signal report, and 73, all at a two-minute rate.

A total of 12,176 QSOs were logged. The last one went into the book at 1457Z April 22, five days and four-

Generals Get HF SSTV

The FCC has amended its rules to allow general class amateurs to operate SSTV on any frequency where they are authorized voice

transmission. The action by the Commission occurred on November 24, and becomes effective February 22, 1982.

Robot celebrates FCC ruling on use of SSTV on General Class Phone Bands

\$100 CASH REBATE

ON ROBOT 400 SSTV SCAN CONVERTER

\$100 CASH REBATE

ON ROBOT 800 SUPER TERMINAL

\$250 CASH REBATE

WHEN THE 400 AND 800 ARE PURCHASED TOGETHER.

With the new FCC ruling approving SSTV on the General Class Phone Bands, and with our \$100 rebate, now is the perfect time to add slow scan TV to your station. Purchase a Robot 400 or 800 from your Robot dealer and receive a check from the Robot factory for \$100.

If you buy both the 400 and 800 together, you get an extra \$50, or a total rebate of \$250. This offer is good through May 31, 1982.

**ROBOT MODEL 400
SSTV SCAN CONVERTER**

Simple to operate, easy to add to your station. All connections to your transceiver are with ready made connecting cables. No modifications required.

List price	\$795
Less rebate	100
	\$695

See your Robot dealer for complete information on this money saving offer and for a free demonstration.

teen hours after we began. Not surprisingly, it was between George and Mike AFØT, with a "job well done" message from Minnesota. It *had* been a job well done, for George had logged 66% of the total contacts. His beam heading had never moved, and a whopping 80% of his contacts were with North Americans. The total breakdown per area was: North America—74%, JA—15%, VK/ZL—4%, and the rest of the world—7%.

We shut down in the wee hours of Wednesday morning, extremely happy and proud of our combined efforts. We sat at the door of the tent and watched the dawn break over the stark beauty of Kingman—we felt an immense bond of comradeship. We planned to spend one day breaking camp and repacking the boat, and sail the following day for Palmyra. That would allow us enough time to be established at Palmyra for the weekend.

And that's just what we did. After the last box came aboard at midday, George and Bill collapsed. They woke briefly for dinner and then hit the sack once more to sleep the night through. Early pre-dawn Thursday morning, the hundreds of pounds of anchor and chain slowly rose from the ocean's depths, needing three hours of coaxing by the ship's anchor winch. By first light we were under sail and heading for Palmyra, forty-five miles away.

That sail was terrible, and seas knocked us about, but by twilight we were in. We located the airstrip and the crashed plane from a previous ill-fated expedition. We moored right alongside the sea-plane ramp and stepped directly on shore. It was a great DX spot and we would have really appreciated it had it been our first or only stop. But it wasn't, and we were simply DXed

The S.Y. Banyandah in search of new adventures.

out, spent, and a little homesick, with a two-week voyage separating us from family and friends. Furthermore, we didn't expect much of a demand since the previous visitor had logged big thousands of contacts. For us, there was simply no challenge at Palmyra; it appeared nothing more than a deserted holiday camp—quite a comedown after the herculean task of activating Kingman.

Setting up camp the next morning was a breeze. We merely walked along the ramp with our gear, boat to shack—the old bunk house for flying boat service personnel. We ran our power supply straight into the building's fused junction box and had lighting at the flick of a switch. An old refrigerator also came to life and soon we even had cold beer. Ah! What a life! A gorgeous view out onto a peaceful lagoon ringed by islands alive with swaying palm trees and a DX station ready to tackle any pileup. Unfortunately, our mood, the mosquitos, and the rats which infested our shack all combined to sour the dream.

George and Bill were on the air by 2116Z that same morning—after a mere four hours to set up. The pileups were there, all right, but not the kind that shoot adrenaline into your veins as you fight to keep them under

control. They died out so quickly that we even shut down for dinner.

During the Palmyra mornings, we all relaxed, fished, or explored the islands. In the afternoons and evenings, George and Bill worked DX while Judith and I prepared the boat for the fourteen-hundred-mile voyage to Pago Pago.

Propagation worsened while the longing for home grew stronger; finally, we closed the station after making the last contact at 0341Z April 29. The total number of contacts logged was 5,320. The breakdown per area was almost identical to that for Kingman.

The rest of the adventure was sort of mundane; a celebration dinner that night, a slow and careful packing up of the boat the next day followed by a refreshing final shower from one of the numerous rainwater storage tanks, and then a long sail halfway across the Pacific to American Samoa. For eleven days, the horizon remained empty. No ships, no aircraft, nothing but a fifteen-mile-diameter visible circle of sea. Finally, at 0930 hours on the twelfth day, from Palmyra and the thirty-fourth since leaving Hawaii, the 2,141-foot peak of Matafao on American Samoa pierced the skyline and the great adventure began its last act.

We rounded the island's eastern tip just after lunch and sailed along its southern shore, feasting our eyes on the greens and yellows while savoring the aroma of land. It was a quiet, easy sailing day and George stood in the companionway describing the lush jungle, quaint villages, and dilapidated buses to Gwen, his wife, who was on the patch.

We entered Pago Pago harbor marveling at the beauty of the gorge and holding our noses from the smell of the fish factory. The anchor went down, the authorities were notified, and the vessel was cleared. That night the final rites for this unique experience were held at a nearby restaurant where we stuffed ourselves on steak and salads. Two days later, George and Bill were gone, and the 1981 Kingman/Palmyra DXpedition became a memory.

The expedition cost \$10,000 not including airfares, hotel bills, and miscellaneous shore expenses. Of that, \$4,740 is still owed to the boat. Most of that will probably have to be written off since our efforts at obtaining post-operation sponsorship died in a flurry of kind words. To date, with nine thousand cards received, little will be left after postage. In fact, we had great plans for a beautiful and dramatic full-color QSL card, a fitting tribute to the achievement, but even this had to be replaced with a two-color card as there just wasn't any money for it.

Nevertheless, it was a true chunk of adventure; it is a memory of achievement, comradeship, and beauty to hold the rest of our lives. And as George recently said, "I don't know when or how, but I'm going to do Kingman again!"

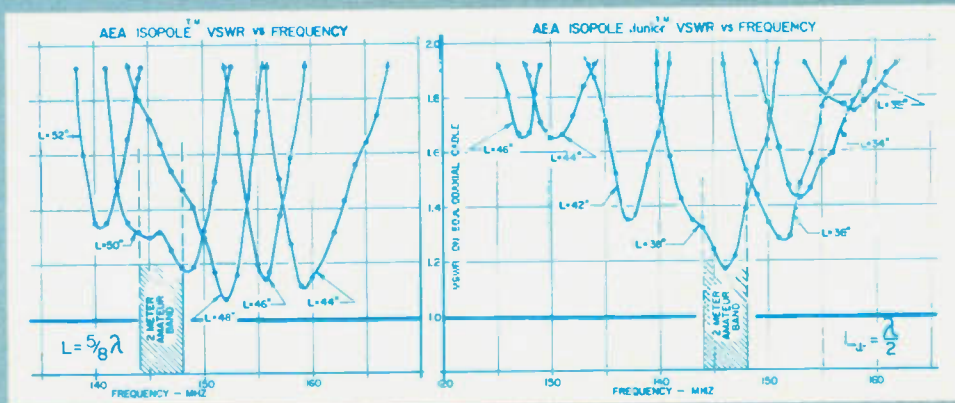

Written on board the S.Y. Banyandah, Wallis Island, South Pacific, 1981. ■

MORE PERFORMANCE FOR YOUR DOLLAR! COMPETITORS KNOW ABOUT THE ISOPOLE™

DO YOU? STUDY THE FACTS ...

The IsoPole antenna is building a strong reputation for quality in design and superior performance. Innovative IsoPole conical sleeve decouplers (pat. pend.) offer many **new** design advantages.

All IsoPole antennas yield the **maximum gain attainable** for their respective lengths and a zero degree angle of radiation. Exceptional decoupling results in simple tuning and a significant reduction in TVI potential. Cones offer greater efficiency over obsolete radials which radiate in the horizontal plane and present an unsightly bird's roost with an inevitable "fallout zone" below. The IsoPoles have the broadest frequency coverage of any comparable VHF base station antenna. This means no loss of power output from one end of the band to the other when used with SWR protected solid state transceivers.

Outstanding mechanical design makes the IsoPole the only logical choice for a VHF base station antenna. A standard Amphenol 50 Ohm SO-239 connector is recessed within the base sleeve (fully weather protected). With the IsoPole, you will not experience aggravating deviation in SWR with changes in weather. The impedance matching network is weather sealed and designed for maximum legal power. All IsoPole antennas are D.C. grounded. The insulating material offers superb strength and dielectric properties, plus excellent long-term ultra-violet resistance. All mounting hardware is stainless steel. The decoupling cones and radiating elements are made of corrosion resistant aluminum alloys. The aerodynamic cones are the only appreciable wind load and are attached directly to the support (a standard TV mast which is **not supplied**).

IsoPole antennas have also become the new standard for repeater applications. They all offer low angle of radiation, low maintenance, easy installation, and low cost with gain comparable to units costing several times as much. Some repeater installations have even eliminated the expense of a duplexer by using two IsoPole antennas separated vertically by about twenty feet. This is possible because of the superior decoupling offered by the IsoPole antennas.

The IsoPole antenna is now available in a 440 MHz version which is fully assembled and tuned.

Our competitors have reacted to the IsoPole, maybe you should too! Order your IsoPole or IsoPole Jr. today from your favorite Amateur Radio Distributor.

ICOM Presents the Minicom IC-25A

Imagine..25 watts/5 memories/2 scanner systems in a 2" H x 5½" W x 7" D 2 meter transceiver!

A very small package with a 25 watt punch, the IC-25A is a full featured FM transceiver for the space conscientious operator. Nearly the same size as an automotive AM radio, the IC-25A will fit in places usually considered impossible for a one piece 2 meter transceiver. The IC-25A is no lightweight when it comes to features:

- 5 memories. Store your favorite frequencies.
- Priority channel. Monitor your most important frequency.

- 25 watts high/1 watt battery saving low power.
- Touchtone™ mic standard..no extra cost...to work your favorite autopatch repeater.
- Full band scan/programmable scan (set your own limits)/memory scan....all with automatic resume after preset delay or carrier drop.
- 2 VFO's with data transfer standard.
- 2 tuning rates 5KHz (A VFO) or 15 KHz (B VFO).
- Nor/Rev switch for instant monitoring of repeater inputs.
- Memory back up power supply option holds memory when attached.

Actual Size.
(Clip this actual photo out and try it in your car.)

ICOM

Hut, 2,3,4...

440, 220, and 146MHz.
Any way you go, ICOM has
you covered...

Complete, affordable and fun...That's
the new ICOM IC-4AT 440MHz handheld.
Identical in size and appearance to the very
popular IC-2AT, the IC-4AT gets you into the 440MHz
band at a very attractive price. The accessories used with
the IC-4AT are the same items you may previously have
purchased for use with your 2AT.

The IC-4A and IC-4AT cover 440 to 449.995MHz in 5KHz
steps, giving full coverage of the FM portion of the 440MHz
band. Featuring ± 5 MHz offsets, top panel switch for control of PL, 16 button
Touchtone® pad, thumbwheel switch frequency selection and ICOM perform-
ance, the IC-4A is unsurpassed in a 440MHz handheld.

The IC-4A comes standard with BP3 battery pack, flexible antenna, belt clip,
earphone and wrist strap.

Top-Notch for Top Band

— super antennas for 160

The 160-meter band, which is in the process of being rediscovered as manufacturers have added the top band to transceivers, poses a special challenge with respect to antenna performance. One of the fascinations of 160 is that it remains the band for which readily-available commercial antennas are not the answer. The situation is further complicated by the fact that an effective 160-meter transmitting antenna is not always a good receiving antenna. Hence, it is often desirable to use a separate receiving antenna. This article describes a specific 160-meter antenna installation with emphasis on the system aspects, as opposed to antenna and circuit design and construction details.

Transmitting Antenna and Ground

The general objective was to provide an antenna installation for all HF bands with good performance on 160 meters, preferably without a tower, which for a number of reasons is not well suited to my property and house configuration. The property available for the installation provides a straight shot of about 120 feet down a narrow open area surrounded by trees about 50 feet high. Ground conductivity is good in the general area and in the specific location.

Because of its flexibility for allband, all-frequency operation (with a transmatch), and because of its suitability to the property configuration, a quarter-

wave (at 160 meters), ended, inverted-L was chosen as the primary antenna. The shack end is supported by a guying halyard on a 15-foot steel TV-type antenna mast secured to a vent pipe on the roof of the house. Stainless-steel hose clamps are used to secure the mast to the vent pipe. See Fig. 1. The halyard is tied to a TV antenna mount that happened to be conveniently in line with the vent pipe.

The center of the flat-top is supported by a line stretched across the top of two trees on either side of the antenna run. The far end is supported at a height of about 55 feet with a line over a third tree. The lines are supported high in the trees and their ends are tied around the trunks of the trees at a convenient height

a few feet above the ground. No pulleys, weights, or springs are used. The tree limbs themselves act as the flexible elements that give in the wind.

The antenna wire is connected to a transmatch about two feet from a ground-floor window, passes through an antenna insulating panel, rises nearly vertical for about 40 feet, and runs out about 95 feet with the flat-top at an average height of about 50 feet.

A note about antenna halyards: Nylon line is excellent but expensive; polypropylene line is much less expensive but deteriorates quickly in the sunlight; with limited experience of only several months, parachute cord (available at surplus

Fig. 1. House-er.d antenna support. Tension is taken by a halyard tied to a TV antenna mast mount rather than by the bending strength of the inverted-L support mast. Side guys would be a desirable improvement.

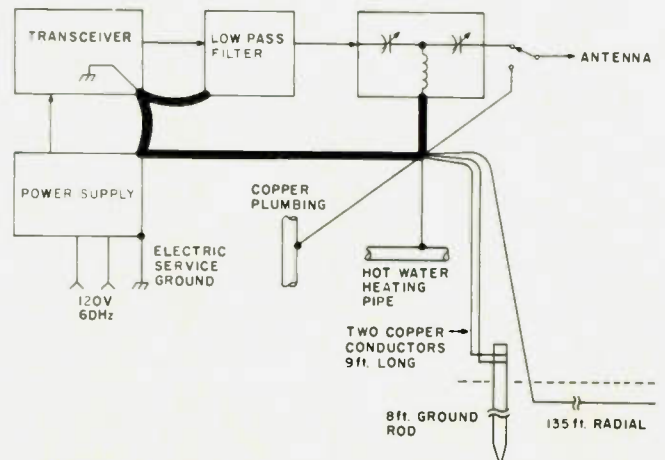

Fig. 2. System ground arrangement.

stores) appears to provide a good, inexpensive solution.

Ground

A quarter-wave antenna requires a low-resistance ground to be an efficient radiator. The station equipment must be properly grounded to keep rf off the equipment chassis and to prevent rf feedback. The grounding arrangement that met these requirements is shown in Fig. 2. The heavy straps shown are all 3/8" braid.

It is common practice to increase radiating efficiency (reduce ground losses) of electrically short antennas by laying quarter-wave conductors out in all directions from the base of the antenna either on or below the ground—the more radials the better. Since in this installation the base of the endfed inverted-L is terminated at the house and because of the narrow width of the lot, even a small number of radials cannot be accommodated. I settled for one 135-foot radial connected to the common ground point inside the window, dropping directly from the window to the ground below and running approximately under and approximately parallel to the horizontal portion of the antenna. The single radial is buried a few inches under the ground to get it out of harm's way.

It did not take long to determine that this antenna and ground combination was a good radiator. However, it left much to be desired as a receiving antenna. Consistently, I was being copied by stations that I could not pull out of the noise. Consistently, the other stations were copying stations that I could not copy. My station was "receiving limited."

Receiving Antenna and Preamp

In searching for a better

Fig. 3. Loop receiving antenna.

receiving antenna, I came across the 5-foot, single-turn, shielded loop in *The ARRL Antenna Handbook* (see Fig. 3). Much to my surprise and delight, this little loop mounted two feet above the ground and working into a preamplifier proved to be a simple, convenient antenna with superior performance. The loop was made of RG-58/U coax mounted on a 6½-foot wooden dowel mast with light wood cross pieces. The mast was mounted on a TV antenna rotor which was in turn mounted on a 2-foot-square plywood base. RG-58/U was also used for the feedline. With the recent reopening of 160, it would be better to construct the loop and feed using lower-capacitance RG-59/U foam cable. This would provide increased performance across the band.

The signal level produced by the loop antenna is quite low but easily can be boosted to an acceptable level with a simple transistor preamplifier. Because the preamp I used was home-built and because there are some associated system ramifications, a description of the circuit is included here (Fig. 4).

This simple preamp was not designed, but rather built from the simplest FET circuit I could find out of

Fig. 4. 160-meter preamplifier. Q1—FET, Radio Shack 276-2036; T1—Amidon T50-2 toroid core, approximately 50 turns (core full), tapped at 6 turns; T2 is the same as T1 except that it is tapped at the center and has a 6-turn link over the ground end.

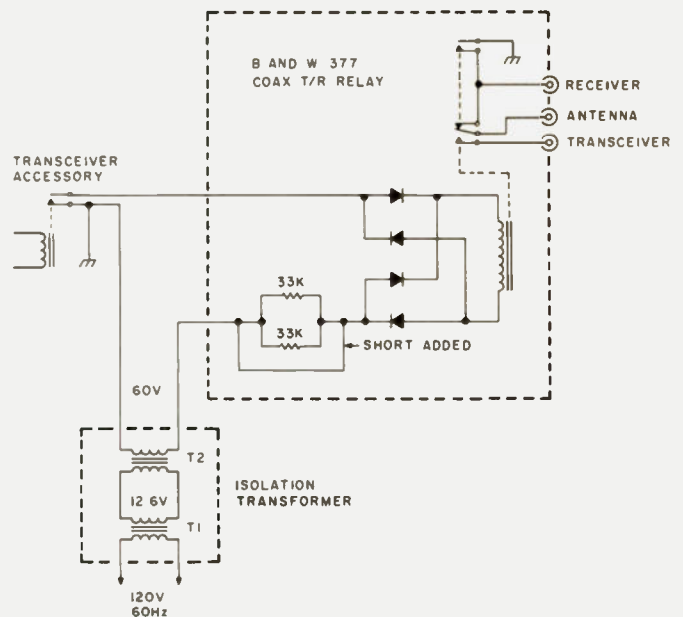

Fig. 5. T-R relay details. T1—Radio Shack 273-1505, 120:12.6 V, 1.2 A; T2—Radio Shack 273-1386, 120:25.2 V, 0.3 A.

available parts. The input and output tuned circuits were arranged to cover 1800 to 1850 kHz. It could undoubtedly be improved, possibly by broadbanding, to eliminate the need for tuning. It provides a gain approaching 20 dB, but in my "brassboard" model is uncomfortably close to oscillation. It performed well enough on the first try that no effort was put into improving it. It would have to be modified to cover more than the 1800-to-1850-kHz portion of the band.

Since this article was first written, the 160-meter band has been opened to 1900

kHz and the loop performance has been improved by replacing the preamp in Fig. 4 with an untuned broadband preamp at the base of and connected directly to the loop.

Note the protective diodes in both the input and output of the preamp. The input is wide open on transmit and there is a danger of transmitting into the output, hence the diode protection on both ends. With 100 Watts into the inverted-L and with the loop antenna about 10 feet from the download, a peak audio-frequency signal of 6 volts is developed across the

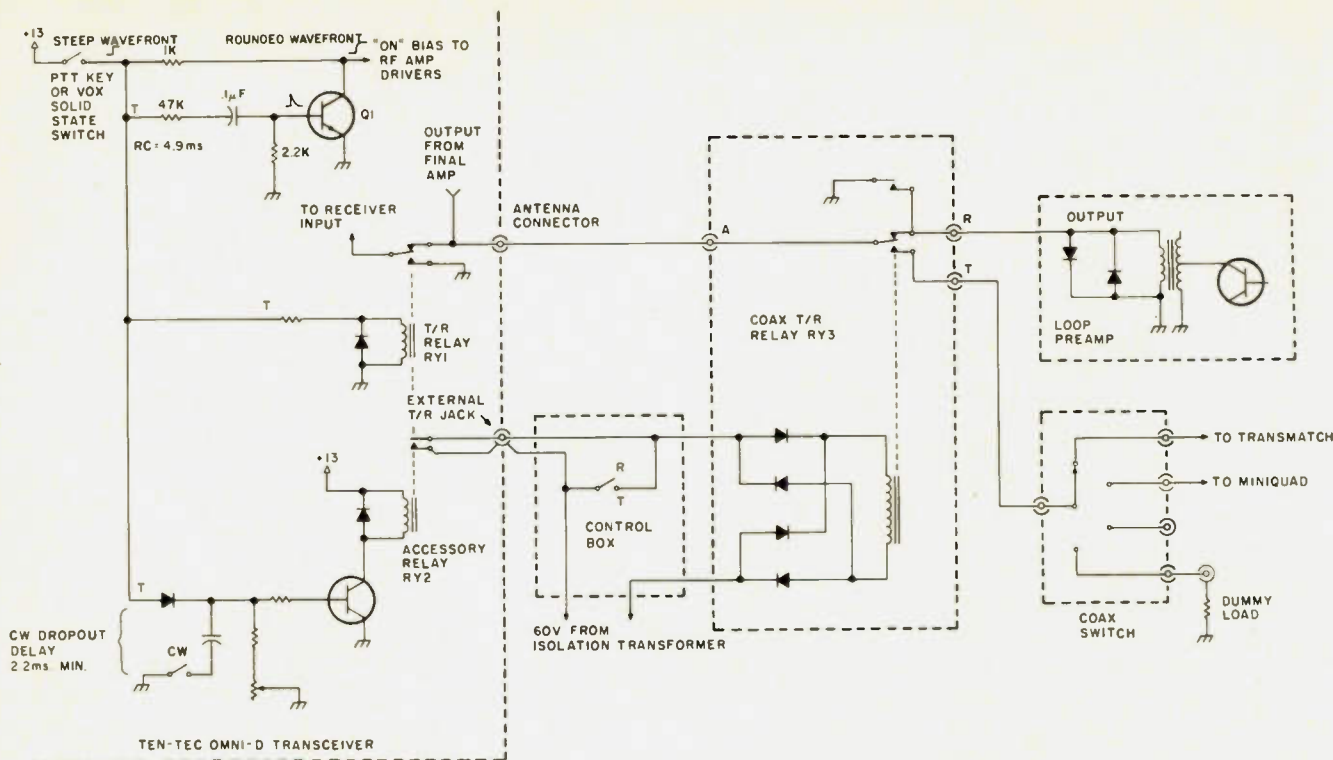

Fig. 6. System functional schematic.

220-Ohm source resistor. This results in a peak current of about 27 mA, equivalent to a peak transistor dissipation of approximately 230 mW. Although not a rigorous analysis, the FET dissipation appears to be well below the 300-mW rating. At a distance of 150 feet, the voltage across the resistor is only a fraction of a volt. In the system arrangement described in a later section, the T-R switching transient into the preamp output causes a 2-volt peak about 8 ms long across the source resistor.

Tuning the loop is simplified because it can be adjusted at ground level. Tuning was accomplished with the length of feedline to be used in operation and with the loop and preamp connected to the receiver. Subsequent experimentation indicated that the loop tuning was affected somewhat by the length of the feedline. A grid-dip meter was used as a signal source. Receiver S-meter readings were observed for incremental adjustments of the loop tuning capacitor until

a maximum meter reading was obtained. A 430-pF capacitor was required to tune the 5-foot square of RG-58/U to 1815 kHz.

T-R Relay and Isolation Transformer

Since some surprises were encountered in obtaining satisfactory performance of the T-R relay and associated isolation transformer, these components will be described in some detail. See Fig. 5.

The B & W coaxial T-R relay is rated at 50 to 120 V, 60 kHz. It turned out to be a 28-volt dc relay with series dropping resistors and full-wave rectifying diodes as shown. Since in the system being described the relay was expected to be energized for long periods during operation on other than the 160-meter band, it was considered desirable to operate the relay at the low end of its current rating. The relay would not pull in on 50 volts until the dropping resistors were shorted. With the resistors shorted, the relay operated satisfactorily on 60 volts.

Isolation of the electric service ground is required because one of the transceiver T-R relay contacts is grounded to the chassis. Using two heater transformers back-to-back was less expensive than the purchase of an available, standard-size isolation transformer and provided a convenient means of reducing the voltage to half the line voltage. The original transformer used for T1 was a 300-mA size; it ran far too hot. It was determined that although rated for 15-Watt output, it was drawing 7.2 VA at no load (disconnected from T2). In operation with the relay-coil load on continuously, T2 runs cool and T1 runs at about 110° F (40° above ambient); surprising, but not unacceptable.

System Integration

A functional schematic diagram of the overall antenna system is shown in Fig. 6. The relays are shown in the "R", or "receive," position. The control box located conveniently on the operating desk contains a miniature switch allowing

the coax T-R relay to be actuated with the transceiver in receive. In this way, the receiver can be instantaneously switched back and forth between the two antennas for comparison. On other than the 160-meter band, the T-R switch is kept in the "T", or transmit, position and the "transmitting" antenna is used for both transmit and receive.

When the transmitter is keyed, or the PTT or VOX switch is actuated, a 13-volt transmit control voltage (T-voltage) actuates RY1 and RY2. RY1 grounds the receiver input and leaves the final amplifier output connected to the antenna connector. RY2 actuates RY3, which in turn grounds the output of the loop preamp and connects the transceiver to the transmatch. Note that the coil circuit of RY3 is grounded only at the external T-R jack.

At the same time the T voltage is applied to RY1 and RY2, it is applied to the transmitter rf amplifier bias bus through a solid-state delay switch, Q1. The resis-

HEATH AND HAMS...

**"PERFECT
PARTNERS"**

Who builds the best Amateur Radio gear around? *You do!* Thousands of Hams attest to the reliable performance, specifications and long-term dependability of Heathkit Amateur equipment. Not to mention the thrill of airing a rig that you've built with your own hands. The more than 200 Hams at Heath invite you to join the fun.

For over three decades, our unique "We won't let you fail" philosophy has created a strong partnership between Hams and Heath, the world's leading electronic kit manufacturer. Heath is committed to designing equipment and accessories of the highest quality that will withstand the test of performance - QSO after QSO.

Amateur Radio is an exciting, worthwhile hobby. Starting and pursuing it with Heathkit equipment is the best way to go. Our complete line can provide everything you need, from a basic Code Practice Oscillator and self-study License Courses all the way to a sophisticated station of operation with remote capability. Pacesetter Amateur Radio enthusiasts are even using Heath/Zenith computers to design antennas, plot beam headings, track OSCAR and transmit RTTY. Heath and Hams, once again, are "perfect partners" in a new adventure.

See the complete Amateur Radio line in our latest catalog or visit your nearby Heathkit Electronic Center*

tor and capacitor in series with the base of Q1 applies a decaying pulse to the base until the capacitor is charged, after which the base voltage returns to zero.

When the positive pulse is applied to the base, Q1 conducts and shorts out the T-voltage on the bias bus. As the pulse decays, the base returns to zero voltage, thus applying the turn-on bias to the final amplifier drivers. This decay softens the keying on CW.

One set of contacts on RY3 grounds the output of the loop preamp on transmit. Since RY3 is in series with RY2, the transmit delay pulse will be completed and the transmitter will be turned on before the amplifier can be grounded. An oscilloscope across the preamp FET source resistor shows a rounded-front switching transient with a fast fall time. This transient is following the transmitter soft keying characteristic followed by a sharp cut-off as the RY3 contacts ground the preamp output. As explained previously, the back-to-back diodes are shunted across the preamp output to suppress this switching transient to a level that will not damage the FET.

CW operation requires further consideration of system functions. RY1 and RY2 are fast-acting relays that can follow high-speed keying. RY2, however, has an adjustable drop-out delay feature to allow proper relay sequencing of external equipment being controlled. The drop-out can be adjusted to keep RY3 actuated during CW keying. In this mode, RY3 will have no effect on keying. The transceiver also can be operated QSK in which mode RY3 can be kept actuated (by the switch in the control box) to use the same antenna for receiving and transmitting. QSK operation

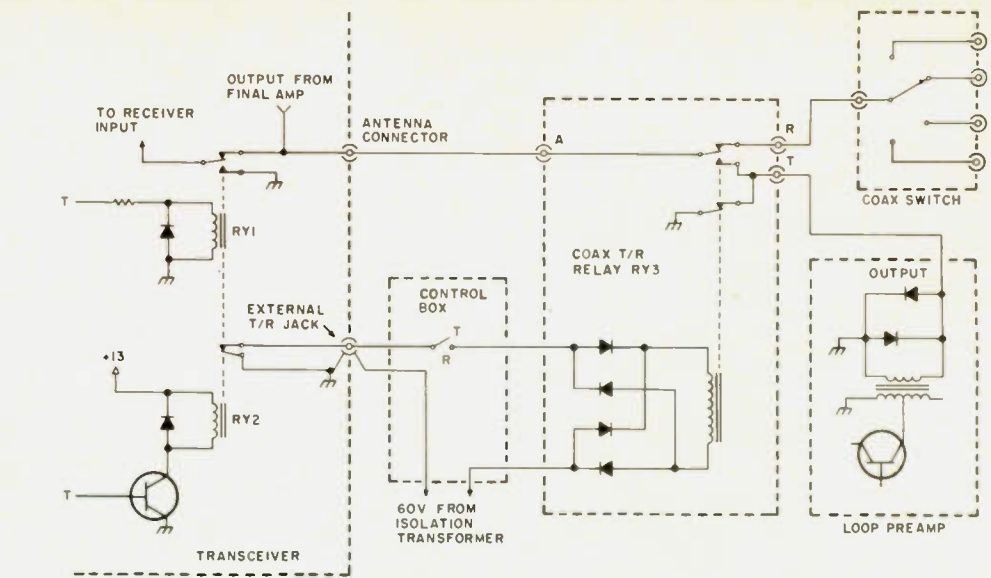

Fig. 7. Fail-safe control circuit.

with a separate receiving antenna will be limited in keying speed.

RY3 is not intended as a high-speed keying relay. The 8-ms system keying delay, the 2.2-ms minimum RY2 drop-out delay, and the drop-out time of RY3 will limit keying speed to less than 13 wpm (estimated). This feature has not been tested. The system can, of course, accommodate high-speed semi-break-in operation.

The control circuit shown in Fig. 6 has the weakness of not being fail-safe. That is, if the voltage to RY3 fails, the transceiver will transmit directly into the output of the loop preamp. To make the circuit fail-safe would require transceiver T-R contacts to be normally-closed. A fail-safe control circuit is shown in Fig. 7. The switch in the control box is connected in series with RY3. The grounding contacts in RY3 should be connected to the T contacts instead of the R contacts as they are in Fig. 6. The relay terminals marked R and T on the relay case are interchanged from the circuit in Fig. 6.

Performance

I have had the opportunity to compare a full-length

160-meter sloping dipole (by extending about 2/3 of it into an adjacent unused property) to the inverted-L and the loop/preamp. The loop was tried in several locations around the yard with the bottom of the square always two feet above the base, including a ground-level, reinforced-concrete slab and a reinforced-concrete slab porch ten feet above the ground. No difference in performance could be detected at any of the locations except possibly some interaction from the inverted-L when the loop was a few feet from the download.

At any given time, different signals would be stronger from any one of the three antennas. The dipole seemed to favor signals from closer stations out to about 250 miles. More distant stations, particularly around 800 miles out, were favored by the inverted-L. The loop preamp, however, delivered stronger signals from more stations more of the time at all distances. Numerous weaker stations were increased to a solid-copy level when smothered in noise on the other two antennas.

The station location is in the high field of broadcast stations about one mile

away on 1500 and 1540 kHz resulting in a host of spurious heterodyne and splatter signals. The loop appears to be less susceptible to this interference than either of the other two antennas. In some cases, the loop brought a signal right out of a heterodyne or splatter on either of the other two antennas.

The loop, however is particularly susceptible to TV receiver horizontal-sweep harmonics, a real disadvantage. In one respect, the loop did not perform as expected. It did not exhibit deep nulls in the plane of the loop. Also, nulls on all ground-wave signals and noise were always in the same direction, possibly because of distortion due to the close inverted-L and two houses.

The end result is a station with convenient operation of a separate receiving antenna and a 160-meter antenna system that is better balanced between transmit and receive performance. More stations are at a comfortable copy level, and more stations can be pulled out of the noise and made readable. The improvement is not worth-shaking, but a 6- to 10-db improvement in receiving capability has been achieved. ■

Future Technology Today

NEW DK200/DK210 Electronic Keyers

CW is both communication and art. Sharpen your "fist" with Daiwa precision!

DK210—L.E.D. Speedmeter: Reads speed to 50 WPM • Lambic operation with squeeze key • Automatic, semi automatic, or tune modes • Dot-dash memory • Solid state keying • Weight Control: Adjusts dot-dash space ratio • Dimensions: 150W x 62H x 150D m/m • Rugged, all metal cabinet

DK200—Same as DK210 without L.E.D. speedmeter

NEW AF606K/AF406K All Mode Active Filters

Luxurious selectivity at an affordable price!

AF606K—Innovative PLL Tone Decoder circuitry locks onto the CW signal and reproduces it with incredible clarity • Variable Notch Frequency: 300-3000Hz • CW Pass Band: 140Hz., 110Hz., & 80Hz • Lowpass and Highpass filtering for excellent SSB reception • Built-in speaker • Dimensions: 150W x 62H x 150D m/m

AK406K—Same as AF606K without PLL Tone Decoder • CW Pass Band: 170Hz., 140Hz., 110Hz., 80Hz

NEW LA2030 2 Meter Power Amplifier

Be Heard! Give your hand-held the boost it needs!

LA2030—Selectable power output: Low (15 watts) or High (30 watts) (all models) • Power Input: 150mW - 300 mW (LA2030A), 300mW - 600mW (LA2030B), 1.5 - 2.5 watts (LA2030C), Choose the model that's right for you • Fast acting protection circuitry • RF level indicator • BNC input, SO-239 output • Compact size: 90W x 42H x 121D m/m

CNA2002 Automatic Antenna Tuner

State-of-the-art automatic antenna matching in under 45 seconds.

CNA2002—Frequency range: Amateur bands 3.5 - 30MHz, including new WARC bands • Power Rating: SSB-2.5 kW PEP, CW-1 kW (50% duty), AM-500 watts, SSTV, RTTY-500 watts (10 minutes) • Dummy Load: 50 watts continuous (100 watts/1 minute) installed • Two antenna outputs for unbalanced lines • Dimensions: 225W x 90H x 275D m/m

CNW518/CNW418 Manual Antenna Tuners

Maximize station performance with high quality Daiwa tuners.

CNW518—Frequency range: Amateur bands 3.5 - 30 MHz, including new WARC bands • Power Rating: SSB-2.5 kW PEP, CW-1 kW (50% duty) • Two antenna outputs for unbalanced lines • Dimensions: 225W x 90H x 275D m/m

CNW418 (not shown)—Same specifications as CNW518 except: Power Rating: SSB-500 watts PEP, CW-200 watts • Dimensions: 225W x 90H x 245D m/m

CN520/CN540/CN550 Cross Needle Meters

Daiwa cross-needle convenience in a compact case! Get SWR and Power readings in a single glance.

CN520—Frequency: 1.8 - 60 MHz • Power rating: 2 kW max. • Sensitivity: 40 watts minimum • Accuracy: $\pm 10\%$ at full scale • Dimensions: 72W x 72H x 95D m/m

CN540—Frequency: 50 - 150 MHz • Power rating: 200 watts max. • Sensitivity: 4 watts minimum • Accuracy: Same as CN520 • Dimensions: Same as CN520

CN550—Frequency: 144 - 250 MHz • Power ratings: 200 watts max. • Sensitivity: 4 watts minimum • Accuracy: Same as CN520 • Dimensions: Same as CN520

AMATEUR RADIO INNOVATIONS

The Fun-Amp

— 20 Watts out

The Fun-Mitter transmitter, described in *73 Magazine* (February, 1981), has provided an easy, affordable, and fun way to explore home brew and QRP. Some amateurs have expressed an interest in an amplifier that would boost the output of the 5-Watt Fun-Mitter. The Fun-Amp described in this article will do just that. The Fun-Amp is a CW amplifier that will provide about 20 Watts of output power. It also is based on the same criteria as for the other Fun gear, to make for a simple, inexpensive way to quadruple the Fun-Mitter power.

The Fun-Mitter, Fun-receiver, Fun-Oscillator, and now the Fun-Amp have all been designed with the casual home brewer in mind.

The objective for this entire series has been to provide designs for gear that can be duplicated easily by all amateurs. All parts are available at Radio Shack outlets and each piece of gear is designed for a "no-tuning-adjustment" approach.

The Fun-Amp fits in quite nicely with this approach. In fact, it is probably the simplest and easiest to build of all of the items described so far. Total parts count in the Fun-Amp is under twenty, which includes the bypass capacitors.

The objectives for the Fun-Amp are basically the same as for the other Fun gear:

- Approximately 20 Watts output.

- No modifications to the Fun-Mitter.
- Same size PC board; same size case as for the other Fun projects.
- No tuning adjustments.
- All parts available from Radio Shack.
- Cost less than \$25.

The objectives not only were met, but as the design evolved into its final form, the Fun-Amp became the best example of the philosophy behind this series.

Circuit

One of the exciting parts of this project is the use of the latest state-of-the-art technology. The active devices Q1-Q3 are VMOS FETs (Vertical Metal Oxide Semiconductor Field Effect Transistors). These devices

have been available for several years but are just recently being used in amateur gear. I found it exciting to design and experiment with these devices and to discover that they truly do live up to their textbook billing. They also are very rugged, something that is a definite asset for home construction.

The advantages of VMOS FETs are numerous. Of utmost importance to this design is the lack of thermal runaway and the freedom from "mismatch" burnout. Thermal runaway is the condition that exists in regular transistors when the collector current increases the heat of the transistor, which causes more current flow, which causes

more heat, which causes more current. Eventually, the transistor can self-destruct. VMOS FETS have just the opposite effect—more heat tends to decrease current flow.

Mismatch burnout occurs in regular transistors when an impedance mismatch occurs between the load (antenna) and the output network. This is seen when a high SWR exists—such as with an open line or non-resonant antenna. This condition can destroy most transistors quickly, but the VMOS FET comes through with flying colors.

Additional benefits of the VMOS FET are the ease of parallel use and ease of matching input and output. In order to reach the 20-Watt output level with Radio Shack parts, it was necessary to parallel three VN67AF VMOS FETs. No current hogging exists with VMOS, so no “ballasting” resistors were needed.

One problem of the

VN67AF VMOS is the built-in static protection zener diode. This diode limits the maximum gate-to-source voltage which in turn limits the output power. Unfortunately, Radio Shack sells only the VN67AF. VMOS devices are manufactured without the zener diode, but in order to meet the objective of Radio Shack part usage, they were not used.

Fig. 1 shows the simple schematic of the Fun-Amp. I decided to use as simple a design as possible and thus eliminated an input network and an intricate output transformer. A good design goal for home-built equipment is “make it as simple as possible.” The amplifier, however, does not suffer in performance due to the simplicity.

The input from the Fun-Mitter is applied to a “pi-type” attenuator (R1, R2, R3). This reduces the input power to the VMOS FETs to the needed level. The Fun-Amp can be driven with on-

ly 2 Watts, if desired, to reach the 20-Watt output level. This will be described in detail later. Three VN67AF VMOS FETs are used in parallel to generate the 20 Watts of rf power. Each FET supplies about 1/3 of the total power.

Because of the VMOS’s built-in zener diode, CR1 has been added to the circuit. It clips the input sine-wave signal so that it does not go negative. If CR1 was not in the circuit, the FET would quickly be destroyed.

There is no forward bias used on the FETs and thus the amplifier operates in Class C. This is significant for two reasons. One, the amplifier can be used only for CW operation. SSB operation will result in severe distortion. Secondly, Class C operation results in high efficiency (power

in/power out), which is a definite plus.

The output network consists of L2, L3, and C3. This network is commonly referred to as a T-network and its function is to match the output impedance of Q1-Q3 (16Ω) to the 50Ω antenna load. It also offers some harmonic attenuation. L2 and L3 are constructed from Radio Shack 10-μH rf chokes—a technique familiar to builders of the earlier gear.

The amplifier is operated from +24 V, same as the Fun-Mitter. Current needed for the amplifier is around one Amp. The power supply described in the Fun-Mitter article should work fine, provided the regulator is mounted on a good heat sink, such as part number 276-1361. Total demand from the supply if both the Fun-Mitter and Fun-Amp

Fig. 1. Schematic.

L2	Modified 10-uH rf choke	273-101
	For 80 meters remove 14 turns	
	For 40 meters remove 19 turns	
L3	Modified 10-uH rf choke	
	For 80 meters remove 10 turns	
	For 40 meters remove 15 turns	
Q1-Q3	VN67AF VMOS power FET	276-2071
R1,R3	For 5-Watt Fun-Mitter use 150Ω, 1/2 W	271-013
R2	For 5-Watt Fun-Mitter Use 33Ω, 1/2 W	271-007
R4	47Ω, 1/2 Watt	271-009
R5	47k Ω, 1/4 Watt	271-1342
R6	155Ω (three 470Ω, 1/2 W in parallel)	271-019
S1	SPDT switch	275-612
Misc.	TO-220 heat sink (3)	276-1363
	Heat sink grease	276-1372
	Case	270-251
	Hardware	64-3012
		64-3019
	Wire	278-1304

are used will be less than 1.5 Amps, which is within the LM317 ratings. Because of CW operation, the actual average current will be around 3/4 Amp (50% duty cycle). Also, four lantern batteries can be used in series to provide +24 volts. Battery life will be reduced, however, due to the higher current levels of the Fun-Amp. Transmit/receive switching is accomplished by K1. This DPDT relay switches the Fun-Amp from receive to transmit when needed.

Construction

The Fun-Amp is built on the same size PC board as all earlier projects (2-1/4" by 3"). The PC layout is given in Fig. 2. Constructing the Fun-Amp should be very easy. However, as has been discovered by some hams building the earlier goof-

proof projects, there is always a possibility for error. Basically, any problems that hams have encountered have been in one of three areas:

- Poor soldering (good solder practices are a must!).
- Faulty Radio Shack components.
- Non-use of PC boards.

In building the Fun-Amp, use a low-wattage soldering iron and rosin-core solder. Heat each PC pad and then apply the solder. A good connection will have a shiny appearance.

PC board use is recommended, particularly for first-time builders. Use the pattern given in Fig. 2. This will help avoid wiring errors. PC boards are available from me for \$7 for those who are not inclined to build their own.

Because of the increase

in power, a method is needed to dissipate the heat produced in Q1-Q3. Radio Shack heat sinks designed for a TO-220 transistor case are used for this purpose. Q1-Q3 are TO-202 devices, so a slight modification is needed. A new hole (approximately 1/8") needs to be drilled through the heat sink below the existing one. Use one of the FETs for a pattern, ensuring that the tab is flat on the heat-sink body. A #6 screw and nut can be used to mate the FET to the heat sink. Use a small amount of heat-sink grease (part number 276-1372) between the FET tab and the heat sink. These heat sinks work quite nicely even though they will become quite warm during CW operation.

To construct C1, connect one 470-pF and one 100-pF capacitor in parallel. Piggyback the two caps and solder the leads. Insert only one wire per leg into the PC-board hole.

To construct L2 and L3, use the same method as was used in all of the earlier projects. Remove the exact number of turns specified in the parts list, depending on whether your Fun-Amp is for 80 or 40 meters. These coils are less than optimum as inductors at the higher power level, but they work quite well and are particularly easy to reproduce.

Coax should be used for

all rf connections to and from the relay and the PC board. Number 18 gauge (or similar) hookup wire can be used for the supply lead to and from J3 and S1.

The amplifier should be mounted in an enclosure. This provides rf shielding as well as protecting the PC board and relay from accidental shorting from outside devices. The Radio Shack cabinet mentioned in the parts lists is easy to work with and fits the PC board nicely.

As mentioned earlier, a relay-control voltage is needed to operate K1 which switches the amplifier in and out of the circuit. This voltage comes from the Fun-Mitter and is tapped off the +24 T-R voltage. If the Fun-Mitter was modified for use with the Fun-Ceiver, then merely run another wire from the jack to J4 of the Fun-Amp. If the Fun-Mitter has not yet been modified, it should be modified as shown in Fig. 3.

The key to goof-proof construction is to have all parts available at construction time and then to load and solder all parts carefully. This approach should yield a product that will work "first-time," a truly exciting moment in home brewing. The Fun-Amp construction, as mentioned earlier, should be completely goof-proof from loading to using!

Operation

Turning on the Fun-Amp should be even easier than building. No tune-up adjustments are needed. Merely apply 24 V, a relay-control voltage, and an input signal—and an output signal should appear!

Before applying +24 V, however, it might be wise to check for shorts. Visually inspect the PC board for solder or etching shorts. If an ohmmeter is available, a reading of greater than about 100 to 200Ω should

Fig. 2(a). PC board.

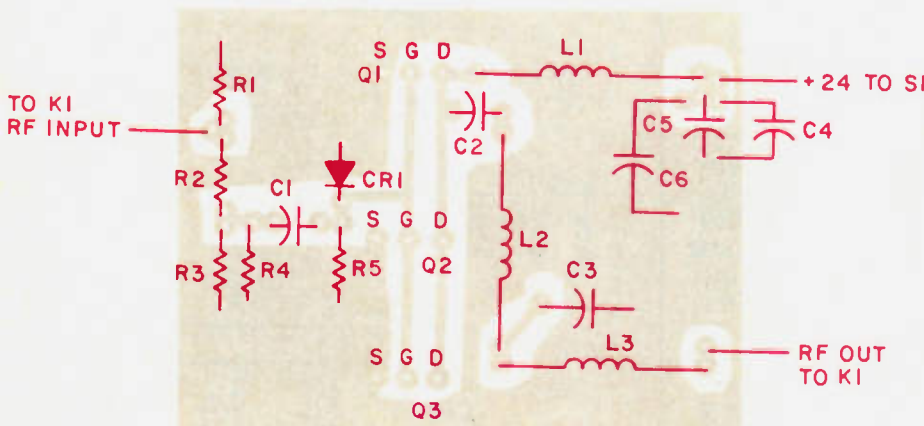

Fig. 2(b). Component layout (foil side view).

New, Simple, Modern, Fast.

Capable of communication rates to 300 baud, the TU-300 is designed specifically for modern high-speed and standard RTTY applications. The TU-300 operates with standard microcomputer, TTY and radio equipment and is TTL and RS 232-C compatible. Controllable by remote, this next generation terminal unit with innovative modular design provides more than six times the conventional amateur data transmission rate using present radio and computer equipment. Featuring three frequency shifts, the TU-300 is the only 300 baud terminal unit offered in easy to construct kit or wired.

DEALERS! Fleisher Corporation is seeking qualified dealers for the US and international markets. For complete dealer information, call or write TODAY!

- 300 baud communications rate
- autostart motor control with AC outlet
- remote operation
- crystal AFSK with downshift CW ID (optional)
- high quality commercial construction
- modular design with steel case for RF shielding
- indicator type push-button switches
- separate send and receive "reverse shift" controls

- bar graph tuning and LED function indicators
- mark-hold and selective fading compensation
- 3 shifts (170Hz standard - other shifts extra)
- oscilloscope tuning outputs
- easy to tune multipole active filters
- TTL and RS 232-C compatible I/O's
- optional 20 and 60ma optically isolated loop supply
- simple kit construction - no instruments needed for alignment with AFSK installed

For more information about the TU-300, contact:

Fleisher Corporation

913-234-0198 • Telex 437125

23

occur between ground and the drains of Q1-Q3 (with S1 off). This reading will vary depending on the model of ohmmeter you have and the polarity of the leads. However, if it is near zero Ohms, re-inspect the board and components for a short. If you don't have an ohmmeter available, feel at ease to merely visually inspect the board as that will reveal nearly all potential shorts.

If an ammeter is available, connect it in series in the +24 V line going to J3. With no drive applied to the Fun-Amp (and S1 on), there should be a small amount of current flowing (about 50 mA). This current is due to the relay current. Always use a 50Ω dummy load at J2 during tune-up.

Next, apply drive by keying the Fun-Mitter. (Don't forget to connect the relay control voltage to J4.) A reading of around one Amp should exist on the am-

meter and about 20 Watts of rf should appear at J2 as seen on a wattmeter.

If desired, the Fun-Amp can be driven with less than the 5 Watts available from the Fun-Mitter. The attenuator circuit dissipates power, which creates an inefficient circuit. If the Fun-Mitter is run off only 18 V instead of 24 V, then there is less wasted power. About 2 Watts of power output will occur from the Fun-Mitter at 18 V. With two Watts of power input to the Fun-Amp, the values of R1, R2, and R3 should be changed to 330Ω, 15Ω, and 330Ω, respectively. This change will necessitate a change in dc supply voltage to the Fun-Mitter, however, which may be more of an inconvenience than the small amount of wasted power. It is mentioned for two reasons. First, if battery operation is used, going from 24 V to 18 V (for the Fun-Mitter) is very simple

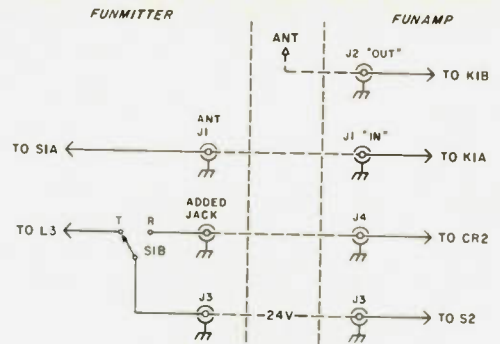

Fig. 3. Connections between Fun-Mitter and Fun-Amp.

and the reduction in current helps prolong battery life. Second, this illustration should help those with other types of transmitters to envision ways to drive the Fun-Amp.

Conclusion

The Fun-Amp should help increase the signal strength of the Fun-Mitter when conditions warrant. It should also be an enjoyable way to construct a useful piece of home-brew gear.

I would be very interested in hearing from hams

who have constructed any of the Fun gear, for your suggestions and to learn of your experiences. ■

Acknowledgements

I would like to thank the many hams who have responded to earlier articles in this series for their suggestions and for their interest.

Special thanks go to Sam Babb for his design suggestions on the Fun-Amp.

Also, I would like to thank my wife, Dottie, for her enthusiastic encouragement and excellent typing skills. She makes writing these articles possible.

NEW PRODUCTS FROM HAL-TRONIX

2304 MHz DOWNCONVERTERS

Frequency Range 2000-2500 MHz

2304 Model 1: Basic three-stage, less case

and connectors.....\$49.95

Stuck with a problem?

Our TE-12P Encoder might be just the solution to pull you out of a sticky situation. Need a different CTCSS tone for each channel in a multi-channel Public Safety System? How about customer access to multiple repeater sites on the same channel? Or use it to generate any of the twelve tones for EMS use. Also, it can be used to access Amateur repeaters or just as a piece of versatile test equipment. Any of the CTCSS tones may be accessed with the TE-12PA, any of the audible frequencies with the TE-12PB. Just set a dip switch, no test equipment is required. As usual, we're a stickler for 1day delivery with a full 1 year warranty.

- Output level flat to within 1.5db over entire range selected.
- Immune to RF.
- Powered by 6-30vdc, unregulated at 8 ma.
- Low impedance, low distortion, adjustable sinewave output, 5v peak-to-peak.
- Instant start-up.

TE-12PA

In Repeaters Some People Want A Super "Loaded"

*Machine -
Others Want A
Basic Unit - With
No "Bells & Whistles!"
Now you can have
Either!*

SCR77

SCR4000

Spectrum now makes 2 lines of Repeaters—the world famous Super Deluxe' SCR1000/4000, and our new Low Cost line of SCR77 Repeaters.

The New SCR77 15 Wt Repeaters maintain the quality of design, components and construction which have made Spectrum gear famous throughout the world for years. However, all of the "bells & whistles" which you may not need or want have been eliminated—at a large cost savings to you! The SCR77 is a real "workhorse" basic machine designed for those who want excellent, super-reliable performance year after year—but no frills! (PL, 12 Pole IF Filter, Front End Preselector, and a 30 Wt. Transmitter are the only 'built-in' options available; but Autopatch, Remote Control, and other equipment can be connected via the rear panel jack.)

Of course, if you do want a full featured/Super Deluxe Repeater, with higher power (30-75 Wts.), and a full list of 'built-in' options, then you want our SCR1000 or 4000—The Ultimate in Repeaters. Available with Full Autopatch/Reverse Patch/Land-Line Control; Touch Tone Control of various repeater functions; 'PL' "Emergency Pwr. ID"; various Tone & Timer Units, etc.

10M FM Repeaters, Remote Bases,

Join the fun with the growing activity on 10M FM! Extended 'superior' groundwave contacts; local Repeaters; Remote/Local Bases and Mobile for Nationwide or Foreign DX. All with the ease of 2M FM! Or, tie a 10M Remote Base into your existing VHF/UHF Repeater!

Our Repeaters and Remote Bases are basically made up of 2-SCR-

RX & TX Boards Now Available!

1000 Mainframes, complete with a VHF/UHF Link "built-in." The 10M FM Receiver is "Super Hot" and "Super Sharp." The transmitter is a 35 Wt. unit with beautiful audio quality.

A Complete Data Package is now available on both complete systems and boards — all commercial quality. Call or write for more information today.

SPEC COMM REPEATER BOARDS & SUB-ASSEMBLIES

These are Professional "Commercial Grade" Units—Designed for Extreme Environments (-30 to +60° C).

All equipment assembled & tested. For 2M, 220 MHz & 450 MHz!

SCR200 & SCR 450 BOARD

10M ALSO AVAILABLE

FL-6

FL-6 Rcvr. Front-End Preselector

- 6 Hi Q Resonators with Lo-Noise Transistor Amp (2M or 220 MHz).
- Provides tremendous rejection of "out-of-band" signals w/out the usual loss! Can often be used instead of large expensive cavity filters
- Extremely helpful at sites with many nearby VHF transmitters to "filter out" these out-of-band signals

CTC100 Rptr. COR Timer/Control Bd.

- Complete solid state control for rptr COR, "Hang" Timer, "Time-Out" Timer, TX Shutdown/Reset, etc.
- Includes Inputs & Outputs for panel controls & lamps

SCT410 XMTR. ASSY.

SCT110 VHF Xmtr/Exciter Board

- 7 or 10 Wts Output 100% Duty Cycle!
- Infinite VSWR proof
- True FM for exc. audio quality
- Designed specifically for continuous rptr service. Very low in "white noise"
- Spurious 70 dB Harmonics -60 dB
- With .0005% xtal.
- BA-10 30 Wt. Amp board & Heat Sink, 3 sec. L.P. Filter & rel. pwr. sensor. BA75 75 Wt. unit also available.

SCR200 VHF Receiver Board

- **Totally New Advanced Design!**
- 8 Pole Front End Fitr. + wide dynamic range—reduces overload, spurious Resp. & IMs!
- Sens. 0.3 uV/12dB SINAD typ.
- Sel. -6dB @ ± 6.5 KHz. -130dB @ ± 30KHz. (8 Pole Crystal + 4 Pole Ceramic Fitr.
- 'S Meter' Discriminator & Deviation Mtr. Outputs!
- Exc. audio quality! Fast squelch! w/0.0005% Crystal. ("Super Sharp" IF Fitr. also avail.)

SCR200 Receiver Assembly

- SCR200 mounted in shielded housing
- Completely asmbld & tested. w/F.T. caps, SO239 conn.
- As used in the SCR1000 Ready to drop into your system! High Recommended!

SCR450 UHF Receiver Bd. or Assy.

- Similar to SCR200, except 420-470MHz

SCAP Autopatch Board

- Provides all basic autopatch functions
- Secure 3 Digit Access; 1 Aux On-Off function, Audio AGC; Built-in timers; etc. Beautiful Audio!
- Q1 Inhibit bd. also available
- Write/call for details and a data sheet

RPCM Board

- Used w/SCAP board to provide "Reverse Patch" and Land Line Control of Repeater
- Includes land line answering circuitry

ID250 CW ID & Audio Mixer Board

- Adjustable ID tone, speed, level, timing cycle
- 4 Input AF Mixer & Local Mic amp
- COR input & xmtr hold circuits
- CMOS logic, PROM memory—250 bits/channel
- Up to 4 different ID channels!
- Many other features Factory Programmed

Repeater Tone & Control Bds.—For SCR1000/4000 & CTC100/D250 only

TRA-1 "Courtesy Tone Beeper" Board

- Puts out a tone beep apx 1 sec after RX sig drops—thus allowing time for breakers
- Resets T.O. Timer after "beep"

TMR-1 "Kerchunker Killer" or "Time Out Warning Tone" Bd.

- For One of above 2 functions
- "Kerchunker Killer" provides adj delay (0-10 sec.) for initial rptr access Auto-Reset at end of QSO
- T.O. Warning Tone provides alerting "warble tone" apx. 10 sec. before "time out"

PSM-1 Repeater Power Supply Mod Kit

- For SCR-1000 or SCR-4000
- Replaces Darlington Pass Tr.—for improved reliability
- Includes new overvoltage "Crowbar" shutdown circuit.
- Complete kit, w/assembled PC board \$19.50 + \$3.50 shipping/handling

PRM200 Power Supply Filter Cap/Regulator/Metering Board

- As used in the SCR1000 as main part of 13.8VDC/8A Pwr. Sply.
- Includes 14,000 µF Filter Cap, Reg. IC and Driver Trans., V/I Meter shunts and cal pots.
- Requires Xfmr., Br. Rect., Pass Tr., Heat Sink, (Optional Meter), for complete supply.

SCT110 Transmitter Assembly

- SCT110 mounted in shielded housing
- Same as used on SCR1000.
- Completely asmbld. w/F.T. caps, SO239 conn.
- 7, 10, 30, or 75 Wt. unit.

SCT410 UHF Transmitter Bd. or Assy.

- Similar to SCT110, 10 Wts nom
- Avail w/ or w/o OS-18 Super High Stability Crystal Osc/Oven.
- BA-40 40W. UHF AMP. BD. & HEAT SINK.

PCB-1 Xmtr. Power Control Board

- For SCT110 or SCT410 Exciters
- Varies B+ to control Pwr. Out
- Switchable HI, Low, or Med. Pwr. out, locally or remotely. Adj. levels

TTC100 Touchtone Control Board

Interface to any Radio or AF system!

- 3 digit ON, 3 digit OFF control of a single repeater function Or (optional) 2 functions (2 digits ON/OFF each)
- Can be used to pull in a relay trigger logic etc
- Typically used for Rptr ON/OFF HI/LO Pwr. P.L. ON/OFF Patch Inhibit/Reset etc
- Stable anti-falsing design 5s Limit on access
- For Add I Function(s)—Add a "Partial TTC" Board

The CCD Antenna Revisited

— does it measure up on 40m?

The articles which appeared in *73 Magazine*^{1,2} describing the concept of the CCD antenna really hit a high spot with me. After all these years of experimenting with and building dipoles and beams, the CCD antenna certainly presented a fresh and exciting project. W4ATE and W4FD deserve a pat on the back for exploring the applications of this concept for amateur use.

My objective in building this antenna was to see if the concept put forth by W4FD, W4ATE, and others who had built this antenna really measured up to the specifications. This antenna per-

forms better than any single wire antenna I have ever built in the past.

I decided on using center feed for this antenna simply because it suited my real-estate layout. The feedline was a good grade of 300-Ohm TV line. Prior to installing the feedline, I applied a heavy coating of floor wax over the entire length of the line. This paid off, especially during wet weather; the impedance of the antenna system remained quite stable. I also tried a 4:1 balun fed with 50-Ohm coaxial cable. At the resonant frequency of

the antenna, the swr was 1.6:1, and at the extreme high frequency end of 40 meters, the swr was 2.5:1.

I cannot quote specific figures of gain, radiation patterns, or angles of radiation for this antenna because I do not have the necessary test equipment nor an antenna range to perform such tasks. However, I can state that I am hearing more stations and have had many more solid QSOs than I've ever had with my inverted V antenna. One thing in particular that I have noticed is that this antenna is much quieter than any other antenna I have used. It's much easier to hear and work weak stations. Don't let the length of the 40-meter antenna deter you from trying it; the amazing thing is that you can zigzag this antenna in just about any plane, including through trees. Another thing that I've noticed is that when I contact another station that is using a CCD antenna, there seems to be much less QSB on the

signals. I have used this antenna on 15 and 20 meters with excellent results. I have no interest in 10 meters, but I'm certain that it will perform well on that band. The other night I had to get on 75 meters to meet a sked, and for the fun of it I tuned up using the antenna matching network. I was able to put out a respectable signal for local work.

It didn't take me long to gather up the parts for this antenna. I had to make the insulators, and for the wire I used the secondary of an old power transformer, which was number 22 wire. It was easy to handle and didn't cost a cent.

Basically, I wanted to build this antenna in such a manner that I could experiment with it and make changes if needed. This approach resulted in the following mechanical configuration. I used 140 feet of thin nylon cord with a tensile strength of 350 pounds. This cord was used as a messenger from which the an-

Fig. 1. Insulator with mounted resistor and capacitor.

Fig. 2. Feedpoint insulator with feeder clamp in place.

Fig. 3. Nylon messenger and 1 section of antenna.

tenna was suspended. Initially, I hung the messenger 3½ feet above the ground.

Next, I made a jig on a piece of wood which had two nails separated exactly 35 inches. Then I bent 48 pieces of wire around the nails, leaving a 2-inch tail at each end. The tails are used to tie in the resistor/condenser combination. When you've finished cutting and bending the 48 pieces of wire, put them aside in a neat arrangement so they won't snarl.

I used 46 one-Watt resistors, with a value of 47k, and 46 Mallory SXM 339 capacitors, 390 pF, at 160 volts dc. Prior to installing these capacitors, I found that 2 were defective, and 1 was not within tolerance. The testing of the capacitors prior to installation can save you a lot of problems and work later on.

The next job was to make 48 insulators and the feedpoint insulator. I used some 1/8-inch Lucite that I had in the junk box. Figs. 1 and 2 give the details. The next step involved mounting and soldering a capacitor and resistor to each section of wire. Remember, you have 48 sections of wire and only 46 capacitor/resistor combinations. Start at the feedpoint insulator and connect the first section of wire (the end without the insulator) to the feedpoint insulator solder lug and solder it.

The other end of the wire will have the capacitor/resistor mounted on an insulator. Refer to Fig. 1 and note the hole at the top middle of the insulator. I used a 7-inch piece of nylon string

and suspended the insulator about 3 inches below the messenger. I continued this process until all the sections were installed and soldered. Using this method of suspending the wire sections allows the antenna to ride free, with no mechanical strain on it whatsoever. So far the antenna has withstood 45-mph winds, rain, and hot sun without any problems. Fig. 3 shows a section of the completed antenna.

The mechanical work is now completed, and we're ready to begin the preliminary antenna tests. I used the authors' design criteria¹ for a 40-meter antenna with a low frequency cutoff of 7050 kHz. I connected a 3-turn loop at the feedpoint insulator and, using a grid-dip meter, resonance occurred at 7002 kHz. Next, the 300-Ohm TV feedline was connected to the feedpoint. About 80 feet of line was needed to reach the shack. I prefer the use of an antenna tuner rather than a 4:1 step-up transformer, because a tuner permits you to tune out any residual reactance in the overall antenna system. Next, I tuned up the transceiver on 7200 kHz and adjusted the antenna tuner for minimum swr between the exciter and the input of the antenna tuner. Using a Bird wattmeter, I set the output of the exciter to 1 Watt. Any swr meter will serve the same purpose; the main consideration here is that only a minimum of power is required to excite the antenna. The rf indicator which I used to check each section of the antenna consisted of a 50 µA meter, using a couple of 1N34s as rectifiers. A 6-inch piece of wire was used as the rf probe. Next, I walked the entire length of the antenna, holding the rf probe at a uniform distance from the antenna, and checked each section. At the ends of each section, I recorded 12 µA, and near the middle of each section, the

rf probe indicated 29 µA. These same approximate readings occurred at each section, right down to each end. In other words, I had a uniform radiating surface over the entire length of the antenna. Remember, this antenna is only 3½ feet above ground. It didn't take me long to get back into the shack and fire up on 40 meters.

The first thing that I noticed was that the receiver was very quiet. Signals were right up there in strength. I made three contacts (about 200 miles) and my reports were Q5 and S9 plus. This was with 100 W dc input. I left the antenna at 3½ feet for about a month and did a lot of listening and QSOing. The results have been more than gratifying.

My next task was to raise the antenna to 50 feet. This was a snap with the nylon messenger. All I had to do was coil the antenna up, take it to the mast, stretch it

out, attach the feedpoint insulator to the halyard, and pull it up. Next the ends of each messenger were snaked through and among the trees and secured wherever convenient. I find it difficult to describe the physical configuration of the antenna, but the feedpoint is up about 50 feet and the rest of the antenna is hidden among the trees. I have 86 trees on the property and an XYL who loves trees; 'nuff said.

All in all, I'm very happy with the results of this antenna and I'm thankful to W4FD and W4ATE for providing me with a very interesting and rewarding project. ■

Antenna-Raising: The Good-Neighbor Policy

— sidestepping civil war

While working as a public relations representative for one of the top five U.S. oil companies, I have learned, among other things, that the truth isn't nearly as important as what the public perceives the truth to be. I knew the instant I put up my very first beam ever, over my new suburban Houston home, that my neighbors were not going to know what it was and what they perceived it to be could cause me a lot of trouble.

My concern for ensuring good relations with my

neighbors might have been prompted by paranoia from continuously explaining oil-company profits and prices, but more than likely it was the fact that my house sat only ten feet away from my neighbors on each side. I lived right in the middle of my subdivision, where the standard lot size was 50' × 100'. Wherever the concern came from, it caused me to plan a little public relations into the installation of my beam. If you're planning to install a beam and/or tower for the first time, you might want to include some public relations, too, especially

if you live close to your neighbors.

In the oil industry, our public relations efforts are often in reaction to something, like bad publicity. You know—high gasoline prices, shortages, excess profits, and the like. We're learning that the more we educate the public about our business, the better understanding and acceptance there is of what is taking place. That makes our jobs in PR a lot easier.

I didn't want to confront problems with my neighbors after I put up my beam, so I set out to educate them about what was going to be on top of my house. Not that I thought that fact alone would persuade them to let me live in peace on 20-meter CW, but I felt sure that if these folks saw an antenna on top of my house without knowing exactly what it was, they were sure to think that I was a CBer running 5000 Watts into stereos, televisions, telephones, and intercoms. Thus, they would try to have my antenna taken down the minute they saw it.

My first action was to make sure that my installation was going to be legal.

Like many high-density subdivisions in metropolitan areas, my subdivision had a homeowners association with a list of strict deed restrictions. Living ten feet apart we needed them! Antennae were covered in paragraph 17: "Maximum Height of Antennae: No radio or television aerial wires or antennae shall be maintained on any portion of any residential lot forward of the front building line of said lot; nor shall any free-standing antennae of any style be permitted to extend more than ten feet above the roof of the main residential structure of said lot."

This wasn't news to me. It was the first thing I checked before buying the house. (For some reason my XYL kept looking at wallpaper.) I already had planned my installation to include a 4" × 4" post anchored to my attic floor, going through the roof at its point, and extending three feet above the roofline. I would attach a nine-foot piece of 2¼" galvanized pipe to the 4" × 4", with the bottom of the pipe flush with the roof.

With the rotor and beam on top of the pipe, the in-

View of my house with antenna on top as seen from across the street. This also shows my next-door neighbor washing his Corvette. He never said a word about the antenna, but he did want to know about ham radio.

HOUSTON, TEXAS 77010

stallation would be exactly ten feet above the roof. I had a two-story house with the point of the roof 25 feet above ground level, so the beam would rest nicely at 35 feet. Cushcraft recommended a minimum of 33 feet, a half-wave at 20 meters, for their ATB-34 tri-band beam.

My next action was to inform the chairman and members of the subdivision's architectural control committee of my plans. Though my installation was going to be legal, if my neighbors started calling these guys, it really could stir up a mess. I wanted to get to them first with facts instead of speculation. Instead of a personal visit to a committee meeting, I decided to write a letter. Here's what I said:

"I am writing to let you know about an antenna I am erecting on top of my house, and to assure you that it complies with the deed restrictions of our community.

"The antenna is an amateur radio beam antenna used for directing radio signals to a predetermined geographical area. Unlike a Citizens Band (CB) radio operator who is limited to 40 channels in one frequency band and five Watts input power, an amateur radio operator, or ham, is licensed to operate on a multitude of frequencies in several different frequency bands using 1000 Watts input power. Thus, it is as common for amateur radio operators to talk with hams in foreign countries as it is to hams in their own hometowns.

"I have been a ham for seven years and have talked with other hams in Europe, Africa, and Asia, including the Soviet Union. The antenna I am erecting will allow me to direct my signals using frequencies in three amateur bands. This antenna will also allow me to conduct emergency communications in our neighborhood should the need ever exist.

"Like most homeowners, I am concerned about the aesthetics of our community and adherence to the community's deed restrictions. In accordance with our deed restrictions, my antenna will not be ten feet higher than the highest point of my roof and it will not have any part forward of the front of my house. For your review, I have enclosed a drawing of how my installation will look. Would you please inform me about your acceptance of these plans. Respectfully,..."

I accomplished several objectives with this letter. I let the architectural control committee know that I was not a CBER, that I had expertise in my hobby, that I was concerned about making sure my installation adhered to our deed restrictions, and that I cared about neighborhood aesthetics. Plus, I asked that the board respond about acceptance of my planned installation.

About two weeks after I mailed the letter, I received a reply from the committee: *"Your planned installation of an amateur radio station antenna is in accordance with the deed restrictions of our community and we plan no action regarding it at this time."* There it was in black and white: "...is in accordance with the deed restrictions..." Believe me, that was a valuable document.

Now to get ready for the installation. I had the 4" x 4" post, 9' piece of pipe for the mast, rotor, and beam. I began working to place the post through the roof and run the coax and rotor cable. A few days away from installation, I wrote another letter, one I planned to give each of my neighbors who would be able to see my antenna from their homes.

I walked up and down the street in front of my house with an eye on my roof. I did the same from

the street in front of my neighbors' houses behind mine. I figured there were 26 homes from which my neighbors would be able to see my beam from their yards. My plan was to give each of these neighbors a letter about the beam the day I put it up. Here's what it said: *"You have probably seen an antenna on top of my house at 7703 Hollow Glen Lane. I want to explain why it is there and assure you that it complies with the deed restrictions of our community."*

I then duplicated the second, third, and fourth paragraphs of the letter I sent to the committee. The letter ended this way: *"The chairman and members of the architectural control committee are aware of the installation of this antenna and have said that it is in compliance with the deed restrictions of our community. There are hundreds of thousands of amateur radio operators around the world, and communicating with them is truly an exciting hobby. If you, your friends, or children are ever interested in amateur radio, please let me know. I would be pleased for you to visit my shack for a demonstration. Respectfully,..."*

Finally, everything was ready. I took a day off from work to put up the beam since I didn't want to do it on a Saturday or Sunday with the neighbors staring at me. A friend came over to help me and up it went without a hitch. Inside the shack, on the second floor directly beneath the antenna, I tuned up, checked the swr, which was nearly one to one, and immediately began working 20-meter DX. It was early afternoon and I stopped long enough to deliver the letters. It is illegal to place such a letter inside someone's mailbox, so I attached the letters to the doors of the houses.

Then it was back to the shack. The efforts I made to

put up the beam were justified, as I worked several new countries in a matter of an hour. My HW-101 was producing 599 signals from Europe, and as I began to turn the beam, my thoughts turned to the neighbors. I didn't know what to expect from them when they got in from work that afternoon and saw the addition to the neighborhood. Whatever happened, I felt good knowing that I had done a little PR in advance of their discovery.

I was kind of scared to go outside for a few days, but the weekend came and along with it yard work. I eased outside and started my Saturday-morning ritual of mowing and edging, along with several of the neighbors. Occasionally, I would look skyward to the beam and think, "My gosh, that's big!" Though there were quite a few folks in their yards who could have grouped to descend on me lynch-mob style, I received nothing more than the usual friendly waves. The weekend passed with twelve new countries on CW and no threats from the neighbors.

A week passed, a month, then several months. Nothing. Not a word. Had I done a good PR job or was there apathy in the community? It's the same question often asked in public relations when we plan for a potential problem but nothing happens. The fact is, I'll never know what might have happened, but I do know what did happen. I operated with my beam for two years before being transferred, working DXCC-CW with about 100 Watts output. I never got any flak over the antenna, but I did get lots of questions about ham radio. I just wonder how many of my neighbors' thoughts changed from aesthetics to my signals around the world as they looked skyward to my beam. ■

KDK MAKES 2 METER FM SIMPLE AND EASY!

KDK INTRODUCES A NEW GENERATION OF 2 METER FM RADIOS.

The sparkling 2025A MKII is loaded with new features! East of operation is the design concept at KDK.

SPECIAL!
WINTER SALE! \$299

Includes:

Touch Tone[®] Mike (Ready to Use)
ORDER NOW DIRECT

● Features such as ten channel memory in two banks of five each, a solid 25 watts of power, full MARS and CAP coverage from 143,000 Mhz to 148.995 Mhz, plus built in memory retention for up to one year . . . and much, much more makes this the radio of the year. If you have been waiting to move up to a new model, or have wished for a radio with "everything" . . . KDK has it!

● The ten channel memory is easily addressable and you have two banks of five channels each. You can even use both banks at once for odd splits.

● Standard 600 hz shift up or down. Band scan or memory scan. Memory scan is easy. There is also band scan with upper and lower limits you can choose yourself!

● Built in niceds for the memory retention which has drain in nano-amps, not milli-amps. The internal battery will hold the memory for up to one year! No other radio offers you this feature.

● Fast and easy dialing. Full solid state dialing and you can choose from the front panel either a fast or slow dial rate.

● No relays are used, only solid state switching. This eliminates a trouble spot many radios encounter.

● KDK has also eliminated another trouble spot by completely hand wiring each radio. No internal plugs to become intermittent and no wire wraps either, just good solid wiring.

● KDK gives you one of the hottest receivers you can find. By using UHF (not VHF) dual gate MOS-FETs with electronic auto tuning for the RF amplifier and the first mixer, you have a combination of ultra sensitivity and maximum quietness.

● The audio output stage in the 2025A Mk II uses an integrated circuit which has internal protection against over-voltage and shorted output conditions. Plus it is a high audio output chip — just what you need in a noisy mobile situation.

● The transmitter uses direct VCO varicap modulation for true FM. Your transmitted audio sounds as it should; crisp, clear and natural.

● The power output stage of the 2025A Mk II will not break down even with an infinite VSWR load, and uses heavy duty solid state antenna switching with a four stage low pass filter. All this gives you an exceptionally clean, spur free output.

● KDK has included an adjustable sub audible tone circuit which can also be used for CTCSS or tone burst on transmit. Again, more features!

● Size is 2 7/10" high — 7 1/8" wide — 9 1/2" deep.

● You can switch from 25 watts to 3 watts low power.

● And, of course, the DC cable is included along with the microphone and mobile mounting bracket.

MICROPHONE EQUALIZER

MODEL EQ 200

Most signals contain excessive lows very few highs that cause them to be muddy sounding hard to copy, lacking articulation and presence of sibilance (s & t sounds) These annoying conditions are NOT solved by audio processing. The answer is EQUALIZATION. Just as broadcasters and recording studios EQ their mic lines, the EQ 200 allows you to reduce distortion, add clarity, presence and sibilance

The card also has a Two Tone Generator circuit. By installing a few components, you can properly tune your SSB transmitter. Two Tone parts Kit \$7.00

25, 50, or 100 Watts Power — Whatever your present output level — from 200 mW handheld on "battery saver" mode to 25W mobile or base — you can use that to drive a compact, 12V power amp from VoCom for much more talk-out power (see chart). Each model has a front panel switch to let you go "barefoot" for short hauls, plus an L.E.D. indicator to show the mode you're in. Full 10 MHz bandwidth gives you virtually unchanged power across the entire 2-meter band. High efficiency design holds down generated heat, low input VSWR saves battery drain by your radio's final amp. Use the chart to see which VoCom Power Amplifier gives you the power out you'd like from the power that you now have.

Power Pocket™ Mobile Amplifier/Charger — Simply plug in your Icom IC-2A(T) and you have a 25W synthesized mobile rig — take it out again, all charged and ready, when you want hand-held operation. Accepts any IC-2A version. Delivers 25W RF output, 2½W audio with 4" speaker to overcome road noise. Charge pocket accepts all Icom battery packs, has independent charging switch, indicator. Mic preamp makes Power Pocket compatible with any mobile microphone and with Icom speaker/mic.

5/8 HT Gain Antenna boosts reception while giving your hand-held full quieting out of spots you're nearly dead in with a rubber duck; provides excellent improvement. Only 8" telescoped, 47" extended. Better than 1.5:1 VSWR. BNC connector.

Spring-loaded 1/4 wave antenna and 4" stubby duck also available. See your favorite amateur radio dealer.

'Lite Receiver IV

— part I: building it is a breeze

This is the first installment of a two-part article on a complete, simple, home-brew satellite TV receiver. If you have been following our satellite TV articles in 73, you know that it is possible to build a

home-brew LNA. And, with our simple downconverter, you have all of the hard parts of your home satellite TV system complete!

The LNA was described in the February, 1982, issue of 73, and the downconverter was described in the March, 1982, issue. With these two additional articles, you can easily build

a complete, reasonably-priced satellite TV receiver capable of outperforming commercial units costing several times as much.

And, with the LNA and downconverter complete, you are down to a reasonable frequency with which to work, the 70-MHz intermediate frequency. If you are tired of dealing with

gigahertz, then the remainder of the receiver will be a breeze!

Refer to the block diagram, Fig. 1. As we previously mentioned, the LNA and downconverter were covered in previous articles. In this installment of the receiver article, we will describe the bandpass filter/i-f amplifier board and the "heart" of the receiver, the video demodulator board. Part II of the 'Lite Receiver IV' article will describe the dual audio board and the afc/meter board. The block diagram also shows the interconnections between the various component parts of the system. The power supply board was described in the February LNA article.

Circuit Development

We started on our home-brew system well over a year ago. It took us about seven months to actually get a picture from the bird(s), and we have spent the last six months optimizing our design, simplifying it so that we feel that any

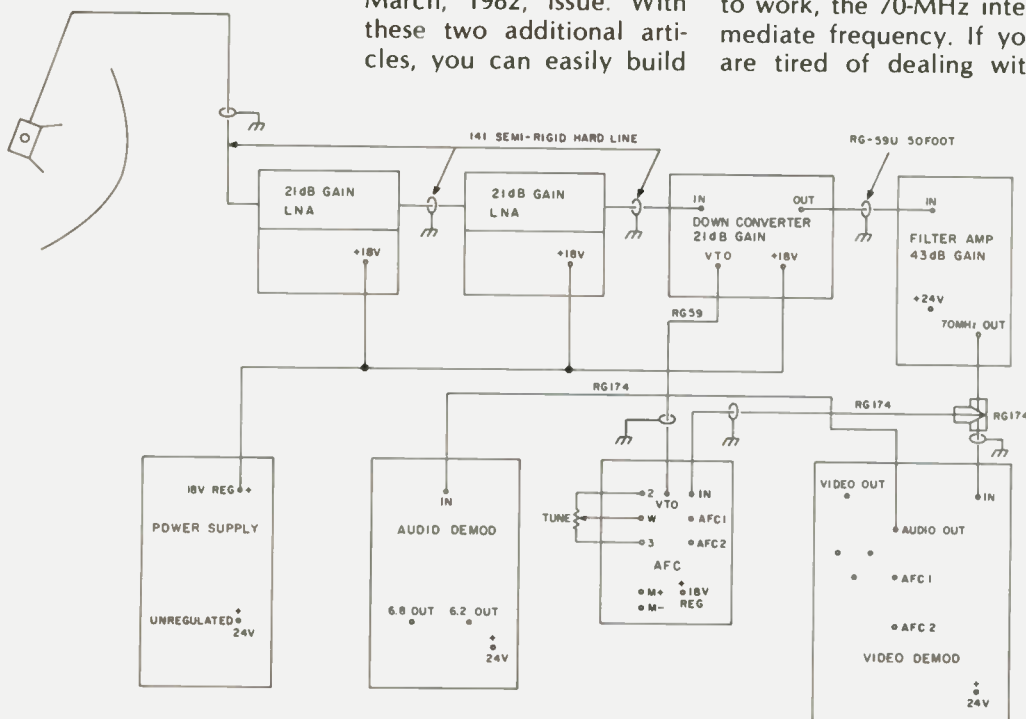

Fig. 1. Block diagram showing interconnections.

One stage of the low noise amplifier (LNA) described in "Job's Own LNA," 73 Magazine, February, 1982.

average technician can easily duplicate our system. You don't have to be a microwave engineer to make it work.

To develop the complete satellite TV receiving system, we used 15 square feet of printed circuit board, 18 pounds of ammonium persulfate etchant for the board, 5 pieces of 10" x 20" photo reversing film making negatives for boards, 48 pounds of coffee, and 32 cartons of cigarettes. We designed, built, and debugged approximately 40 individual printed circuit boards trying various circuits.

We will describe as we go some of the things we tried that either didn't work or didn't meet our expectations. During our development, we were extremely fortunate to have a professional video technician, Alex Guarino WA4OCC, to critique our received signal video and offer suggestions on improving it. Alex now favorably compares our received video with the commercial cable TV installations with which he is familiar.

We had never seen a satellite TV installation before we got our homebrew system working and, during the development of our system, we did not have

access to any test equipment that functions on the satellite TV frequencies. The only test equipment used to debug the system was an old Heathkit Tunnel Dipper (grid-dip meter), a sweep generator, a marker generator, and a 5-MHz Heathkit oscilloscope. So, if we can make a receiver work with our very limited test equipment, we feel that any average technician, using our proven PC board designs, can easily duplicate our system.

The "IV" in the 'Lite Receiver IV* signifies that it is the fourth generation receiver that we have built. The last two were built from the exact PC boards which are in these articles,

*Lite Receiver IV is a trademark of Martcomm, Inc.

Complete LNA with bias power supplies.

and they worked the first time power was applied!

70-MHz Bandpass Filter and I-f Amplifier

Just like your ham band receiver, the signal from the mixer contains many signals and noise. Therefore, the first step after the mixer is to clean up the signal and

eliminate all frequencies we don't need. The output of the mixer is a low-level signal of approximately -50 dBm. Refer to Fig. 2, the filter/amplifier schematic. This low-level signal is applied to IC A-1, a Motorola MWA-120 broadband amplifier with 14 dB of gain.

70-MHz Bandpass Filter/I-f Amplifier Parts List

- 1 2-1/4" x 4" x 2-1/2" minibox, Bud CU-3003A
- 1 PC board, double-sided (Martcomm, Inc., Box 74, Mobile AL 36601)
- 3 MWA-120 ICs
- 1 7815 voltage regulator
- 2 1-uF tantalum capacitors, 35 volts
- 3 470-Ohm, 1/2-Watt resistors
- 2 2200-Ohm, 1/4-Watt resistors
- 1 470-Ohm, 1/4-Watt resistor
- 1 51-Ohm or 47-Ohm 1/4-Watt resistor
- 2 .01-uF disc ceramic capacitors
- 2 J. W. Miller coils, L1 and L4, 49A678MPC, .60-.074 uH
- 1 J. W. Miller coil, L5, 49A347MPC, .250-.415 uH
- 2 J. W. Miller coils, L2 and L3, 49A537MPC, .393-.657 uH
- Total cost is approximately \$60.00.

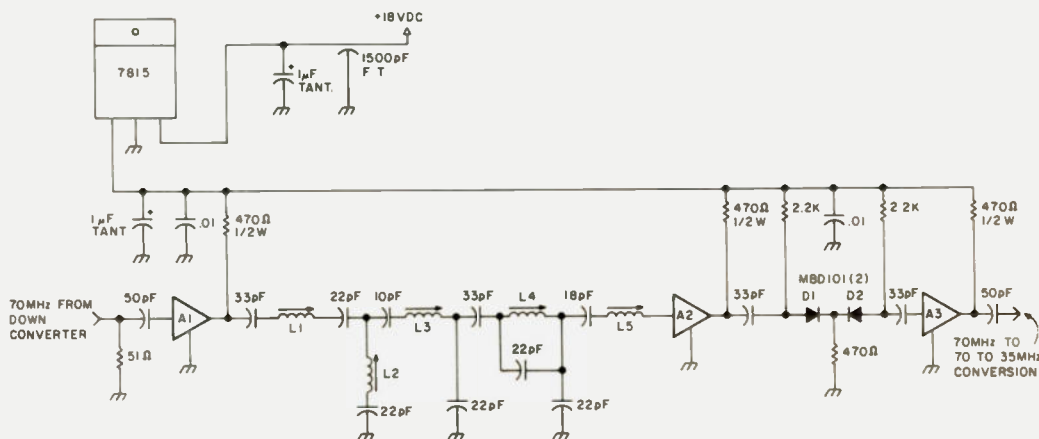

Fig. 2. 70-MHz filter/amplifier schematic.

Power supply for the entire receiver. It was described with "Job's Own LNA," 73 Magazine, February, 1982.

The output of IC A1 is fed to the 70-MHz bandpass filter consisting of coils L1 to L5 and their associated capacitors. The bandpass filter has a center frequency of 70 MHz and a 30-MHz bandwidth at the -3 dB points. The output of the filter is applied to IC A2, another MWA-120, for additional gain, and then through hot-carrier diodes

D1 and D2 for some limiting. The output of the diodes feeds another MWA-120, A3, for another 14 dB of gain. The total gain of the 70-MHz stages, less the filter insertion loss, is approximately 43 dB.

A PC board for the filter/amplifier and a parts overlay are shown in Fig. 3 and Fig. 4, respectively.

A phase-locked loop

(PLL) was chosen for the video detector since it can demodulate very low signal levels. But the PLL is prone to overload, so one stage of limiting using hot-carrier diodes was needed to smooth the signal level. Limiting is necessary because signal levels vary from transponder to transponder.

Printed Circuit Board

The PC board was designed to accept readily-available components. We found that the J. W. Miller pre-wound PC coils, although relatively expensive, are simple to work with and the filter can be duplicated more easily with known inductance values. The entire assembly fits in a 4"x 2-1/4" x 2-1/2" minibox with the input and output coax connectors being either BNC or type F. The +18 volts dc required for the MWA-120s is brought into the minibox through a 1500-pF feedthrough capacitor which is bolted to the

minibox. The 1500-pF value is not critical, and you can substitute any reasonably close value. A word of caution about the Motorola MWA-120s. Buy them only from prime sources. We have had bad luck with the 120s, with about one out of three being bad. So, buy a couple of extras, just in case.

Construction

Construction is very simple if you use the double-sided printed circuit board layout shown in Fig. 3. A parts overlay is shown in Fig. 4.

First, mount the MWA-120s on the component side of the PC board. Be sure that they lie against the copper backplane and that the pins are in the correct holes. Solder the IC tab to the backplane. Then solder and clip the excess leads on the bottom of the board. Install the 3 feedthrough jumper wires very close to the ground pin of the MWA-120s. You can use a piece of resistor lead for the feedthrough jumper wires. Be sure to solder the jumper wires on both the bottom and top of the board.

Now install and solder the remaining components on the board. Some of the components are a tight fit due to the very compact size of the assembly. After the PC board assembly is complete, check to be sure that all components are in their proper place and that there are no solder bridges.

Next, drill the 3 holes in the minibox for the coax connectors and the feedthrough capacitor. Also drill the 4 holes for the PC board standoffs, which can be either regular standoffs or long 6-32 screws. Since the Bud minibox is 2-1/4" high and this height is not needed, we cut ours down to 1-1/2" high. When the box has been prepared, install the 1" standoff spacers. Use cutoff resistor

Fig. 3. PC board for the filter/amplifier.

Fig. 4. Component layout for the filter/amplifier board.

Bottom view of the video demodulator board.

leads or small pieces of bare wire to connect the center conductor of the coax connectors to the PC board. Use the same technique to connect the +18 volts dc from the feed-through capacitor to the board. Note that the board is installed in the minibox with the trace side toward the top of the box. There are holes in the PC board to allow access to the filter coils from the bottom of the board. This completes the construction of the board. Now comes the fun part, aligning the filter.

Tune-Up

The filter alignment is not nearly as difficult as everyone would have you believe. You can tune it in one of two ways: 1) with a sweepmarker generator and oscilloscope with a demodulator probe, or 2) with the receiver tuning meter (which is incorporated on the afc/meter board). We don't recommend using the

tuning meter approach; the result was as good as using the sweep generator, but you have to have a lot of patience to do it that way.

To align the filter using the sweep generator and marker generator, connect the output of the sweep generator to the input of the filter (marked "IN" on the PC board). Connect the scope's demodulator probe to the output (marked "OUT" on the PC board). See Fig. 5. Preset all coil slugs to mid-position in the coil forms. Apply power (+18 to +23 volts dc) and, with a voltmeter, check the output of the voltage regulator. It should be +15 volts. Next check the voltage from ground to each MWA-120/470-Ohm, 1/2-Watt resistor junction. The voltage should be approximately +5 volts at each of the three points. If your wiring is OK and the voltage is wrong, then you probably have a bad MWA-120. If this is the case, replace it.

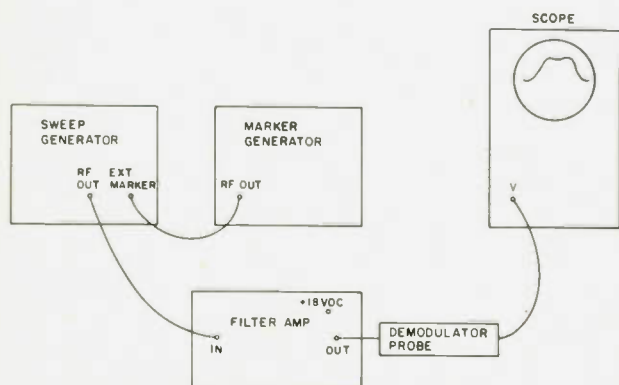

Fig. 5. Alignment setup for the filter/amplifier.

Start with as low an rf level from the sweep generator as can be seen on the oscilloscope. Reduce the rf level as alignment proceeds. See Fig. 6 for the desired bandpass shape. If the sweep is set too wide on the sweep generator, a spike will appear on the left side of the scope trace at approximately 110 MHz. Don't worry; the spike is the second harmonic of the 55-MHz coil resonance. Patience and persistence will reward you with a properly aligned filter. Just remember to make small changes in inductance. For the record, it took us about a day to align the first filter we built from Radio Shack's 100 for \$2.95 coil-form special. The filter built with the Miller coils took only 15 minutes to align!

Video Demodulator

Our first attempt at demodulation used the NE564. It worked for about 5 minutes before the IC got

hot and quit working. We experimented extensively with the 564, ultimately arriving at a configuration which, although very simple, permits adjustment of the critical operating voltages. Our final configuration allows you to optimize for your particular NE564. But, being the experimenters that we are, we wanted to try more traditional ways of demodulating an FM signal.

We tried a bridge discriminator and the "classic" Travis discriminator. They worked, but believe us, aligning a traditional-type discriminator for a 30-MHz-wide signal is a real chore. The traditional types also require a much stronger signal, so extra stages of i-f amplification and limiting were needed. The result offered only marginally better performance over our final 564 design.

We also tried a 70-MHz-to-35-MHz divider so that the 564 would operate com-

Fig. 6. Typical scope display. A spike will show up on the display at 110 MHz if the sweep generator is set to sweep too wide. This will not cause a problem. It is the second harmonic of the 55-MHz coil resonance.

(817) 860-1641

pletely within its specifications. Only slightly better performance was obtained, primarily reduced smearing of bright colors. The divider approach required extra i-f amplification, too. So back to the Signetics NE564 and its simplicity.

NE564 Specifications

The NE564 maximum specifications which concern us are as follows: pin

1—12 volts dc, pin 10—6 volts dc, for a 75-MHz lock frequency at 0 degrees Centigrade. We reduced the pin 1 supply voltage to 8 volts dc and made the pin 10 voltage-controlled-oscillator (vco) supply voltage adjustable through a 1k pot. To try to keep the 564 as cool as possible, a small IC-type heat sink is glued to its top. Otherwise, the circuit is the "typical" FM de-

modulator circuit from the Signetics application notes. The circuit is very simple and gives excellent results. Although the PLL is being pushed a little beyond its specifications, we have found only one 564 out of half a dozen that gave marginal performance. The marginal performer only lasted an hour; it probably was defective to start with. Again, as with the

MWA-120s, you should buy your 564 from a reputable supplier and avoid the surplus outlets. You might want to buy an extra just in case yours doesn't want to hack it at 70 MHz.

Circuit Description

Refer to the video demodulator schematic, Fig. 7. The output of the 564 is dc-coupled to the base of a 2N2222 transistor. The

Video Demodulator

Parts List

- | | |
|----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| 1 NE564 IC | 1 2.2k-Ohm resistor |
| 1 NE592 IC | 1 4.7k-Ohm resistor |
| 3 2N2222 transistors | 4 10k-Ohm resistors |
| 1 7808 voltage regulator | 1 12k-Ohm resistor |
| 1 7815 voltage regulator | 1 22k- to 47k-Ohm resistor, see * on schematic |
| 1 1k-Ohm pot, PC board mount | 6 .01-uF disc ceramic capacitors |
| 1 10k-Ohm pot, PC board mount | 3 1-uF, 35-volt tantalum capacitors |
| 1 2.8-pF variable capacitor, Erie type 538-006A-2-8, or Erie type 518-000A-2.5-9 | 1 22-uF, 16-volt capacitor |
| 1 100-uH choke | 1 470-uF, 16-volt capacitor |
| 1 2.7-uH choke | 1 6.2-volt zener diode |
| 1 4.7-uH choke | 1 MDB-101 hot-carrier diode (1N914 will probably work) |
| 1 47-Ohm resistor | 2 3-pF silver mica capacitors |
| 1 100-Ohm resistor | 1 91-pF or 100-pF silver mica capacitor |
| 4 150-Ohm resistors | 1 300-pF silver mica capacitor |
| 1 270-Ohm resistor | 1 330-pF silver mica capacitor |
| 3 470-Ohm resistors | 2 2200-pF silver mica capacitors, or any combination equaling total capacitance of 4400 pF |
| 1 510-Ohm resistor | |
| 1 560-Ohm resistor | |
| 2 1k-Ohm resistors | |

Note: All resistors 1/4-Watt, carbon composition.

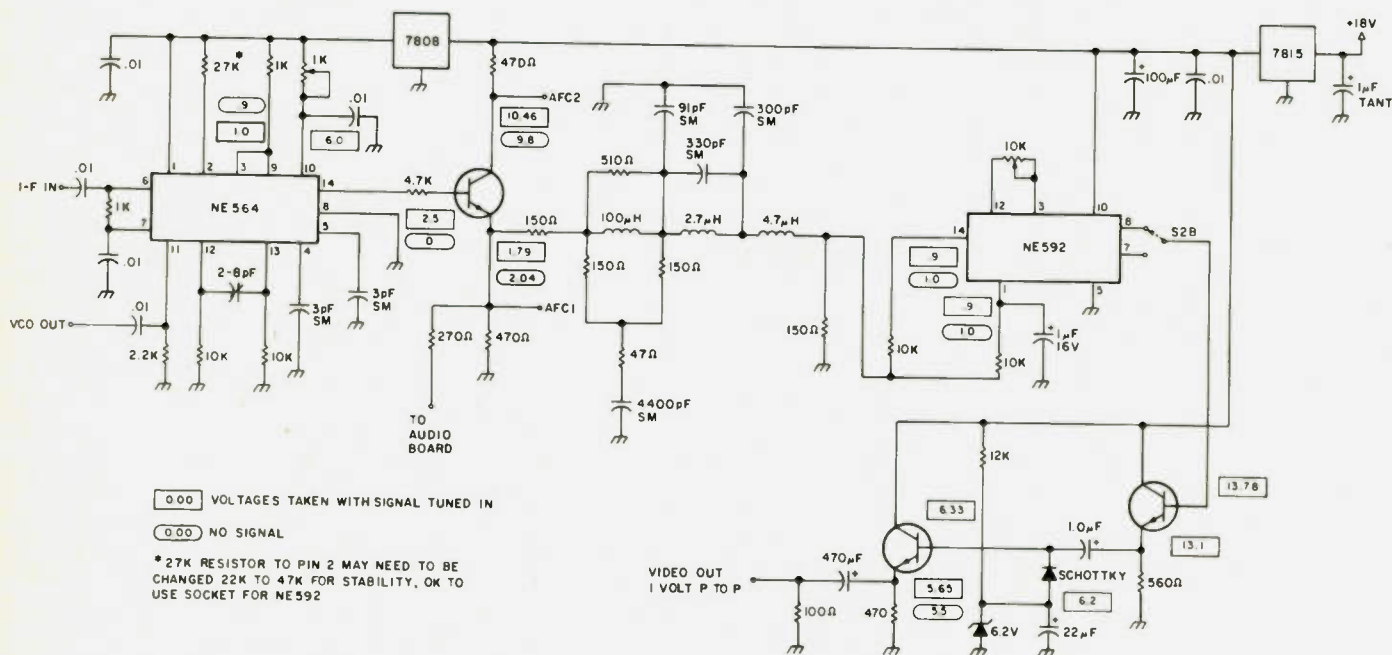

Fig. 7. Video demodulator schematic. The vco capacitor is an Erie type 538-006A-2-8 or 518-000A-2.5-9. All transistors are 2N2222 or 2N706. Set the 1k pot on the NE564 pin 10 for 5 volts. Set the vco to 70 MHz. After the picture is tuned in, adjust the 1k pot for best picture. The pin 10 voltage should be between 4.7 V and 6.0 V. * The 27k resistor to pin 2 may need to be changed (22k to 47k) for stability. It is OK to use a socket for the NE592.

audio and AFC-1 pickoff points are at the emitter of this transistor. The AFC-2 junction point is on the collector of this transistor. The de-emphasis filter also connects to the 2N2222 emitter, and then goes through an audio trap to the NE592 video amplifier.

The NE592 has complementary outputs, which makes it simple to provide video reversal (not all transponders use the same video polarity). The output of the 592 feeds the base of another 2N2222. The emitter of the second 2N2222 is ac-coupled to the base of a third 2N2222 whose base is clamped with a zener diode and a hot-carrier diode to keep the 30-Hz energy dispersal waveform from appearing at the video output. The 30-Hz component, if not removed, will wreck your vertical sync. The 1-volt video output is ac-coupled and terminated with a 100-Ohm resistor.

Construction

To make construction really simple, a PC board really simple, a PC board layout and parts overlay is provided. See Fig. 8. The PC board is double-sided G-10. The parts overlay is shown in Fig. 9.

For easiest assembly, install all resistors first and then the capacitors and chokes. Transistors are installed next, being sure that they are properly inserted. Power up the board and check the output of the voltage regulators for correct voltage before inserting the ICs. Save the ICs for last. You can use a socket for the NE592, but do not use a socket for the NE564.

Tune-Up

The joy of using the NE564 becomes evident when you get to the alignment procedure. Set the 1k pot and 10k pot at mid-position. Apply power. Adjust the 1k pot for 5 volts dc on pin 10 of the 564. Connect a frequency counter or

grid-dip meter to the "VCO out" point on the board and adjust the variable capacitor for a 70-MHz vco frequency. Assuming that you have the rest of your system working, connect the output of the 70-MHz filter if

amplifier board to the video demodulator board. With a video monitor attached to the video output, you should have satellite TV! Congratulations!
The final adjustment is made while watching video

on your TV. Adjust the 10k pot for 1-volt video out or at least good contrast on your monitor. Now is the time to adjust the 1k pot on pin 10 of the 564. Monitor the pin 10 voltage while adjusting the pot. Changing

Fig. 8. Video demodulator PC board.

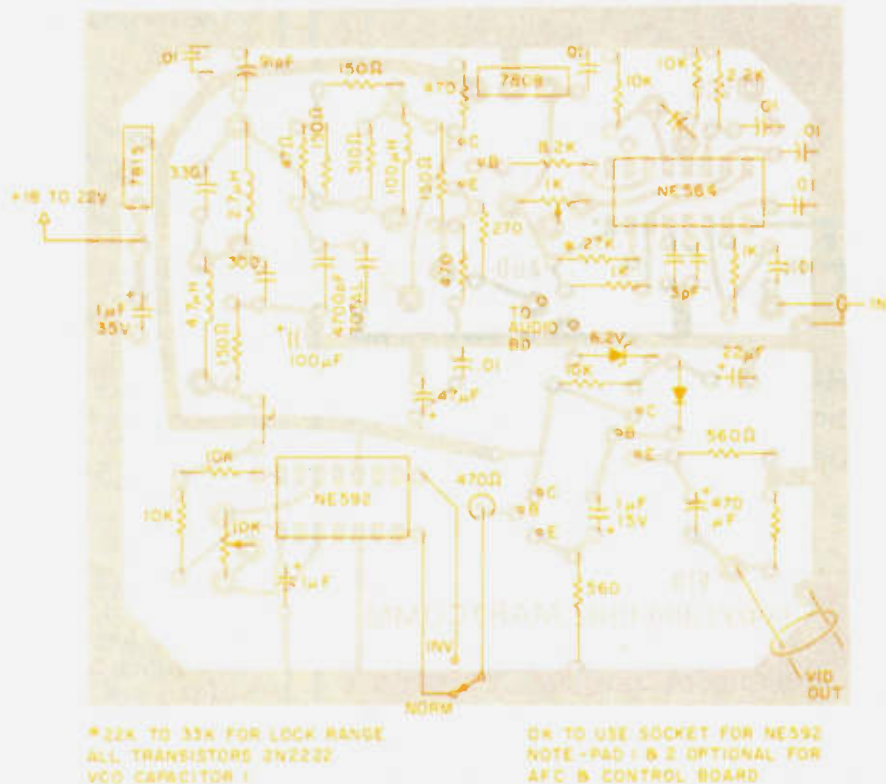

Fig. 9. Component layout for video demodulator board.

The 70-MHz bandpass filter and i-f amplifier before installation in its case.

the voltage on pin 10 also changes the frequency of the vco, so readjust the vco capacitor for 70 MHz after every voltage change. Do not, however, exceed 6

volts on pin 10. Adjust the two pots alternately for best picture and minimum color smear.

If you don't have video, check the voltages as

Side view of the filter/i-f unit after its installation in the case.

shown on the schematic. The values in a rectangular box are with a signal tuned in, and the voltages in the oval boxes are with no signal.

Please, if you write us concerning any of the articles and want an answer, send a self-addressed, stamped envelope for our reply.

Printed circuit boards are available from Martcomm,

Inc., PO Box 74, Mobile AL 36601. The 70-MHz bandpass filter i-f amplifier board is \$12.50 plus \$1.75 for first-class postage and handling. The video demodulator board is \$25.00 plus \$1.75 for first-class postage and handling. Boards for other parts of a satellite TV receiver are available from Martcomm, Inc. Send an SASE for a flyer on availability and prices. ■

Interested In DX?

Dick Bash says you need **THE COMPLETE IDIOT'S GUIDE TO DX** (by Stu Gregg, NF4Z) if:

- ... you think IRC means International Red Cross
- ... you're still working on your DXCC
- ... you think WAC means a female army person
- ... you're not a BIG GUN (yet)
- ... you think the 'BUREAU' is where you put your socks

new

**PRICE REDUCTION
(SEE NEW PRICE BELOW)**

The Idiot's Guide pulls no punches and doesn't 'snow' you with nonessentials, but it does unlock some DXers' secrets; for example: How to QSL. What to say. Where to place your antenna, How much power to use. Whose awards can you get. Why and When to use SSB or CW, and much more... things that you need to know, and information that Honor Roll members had to learn the hard way.

Dozens of DXers have been interviewed and their suggestions have been included here. Take a tip from the "Big Guns" and use their secrets and tricks.

THE COMPLETE IDIOT'S GUIDE TO DX is available at dealers nationwide for only \$9.95, but if you can't stand to wait, rush Dick \$12.45 (which will cover First Class postage). If you live in California, please include 65¢ for Sales Tax. Telephone orders accepted 10 AM#6 PM California time.

TVRO Sound Decoders

— Satellite Central, part VI

There is more than just video up there! Besides the Lucy reruns, you can find special news and entertainment goodies, most of which are carried on separate subcarriers or in the TV vertical interval.

For the moment, let's

Fig. 1. FM subcarriers are located above the video. 6.8 MHz is the most-used frequency for TV sound. An additional eight more 15-kHz audio channels are possible without significant intermod.

cover just the subcarrier services. While 6.2 MHz and 6.8 MHz are the usual frequencies used for satellite TV audio, other frequencies can be found with such things as background or stereo music, not to mention data and clandestine transmissions. But a typical TVRO receiver may have only two fixed-frequency audio detectors, leaving you wanting more!

How Does It Work

Most satellite audio services are carried on FM subcarriers, but sideband audio does appear in several places. At the uplink site, the subcarrier is applied with the video to the main FM video carrier. Once the main carrier is detected in the receiver, the combined video and audio are split. The video must be de-em-

phasized and the dispersion waveform clamped out (see "Satellite Central," 73, December, 1981, p. 54). But the audio subcarrier still must be demodulated. It is fed through a high-pass filter to a tuned FM detector.

The usual transmission format is wideband FM deviating the subcarrier ± 75 kHz or so. Seventy-five μ sec pre-emphasis is used. If this sounds strangely like commercial FM, you're right! But the wider bandwidth possible from the video demands that the FM sound subcarrier be placed higher up in frequency than typical TV sound (4.5 MHz). You may find carriers anywhere from 5.4 MHz to nearly 8 MHz, as seen in Fig. 1.

You can try several ways to detect satellite subcarriers. Surplus decoder units found at swap meets such as

the tube-type Collins SC100C subcarrier demodulator work fine. Just connect a power supply and retune for whatever frequency you want. The coils on the Collins units are easy to tweak. While you can tune by ear, a signal generator always helps.

Another clever way is to mix the subcarrier with a local oscillator and shift it up in frequency to feed a conventional FM tuner. The configuration in Fig. 2 works very well if your tuner is well shielded from local FM interference. Bargain-base-ment transistor radios don't work too well in this capacity, but some of the old tube-type (low sensitivity) tuners gathering dust in the junk box seem to be perfect. The main advantage to this technique is the ease with which you can tune and the feeling

Fig. 2. Use a good mixer and upconvert the video and subcarrier baseband to the commercial FM band for detection on your stereo. Shielding from local interference is very important.

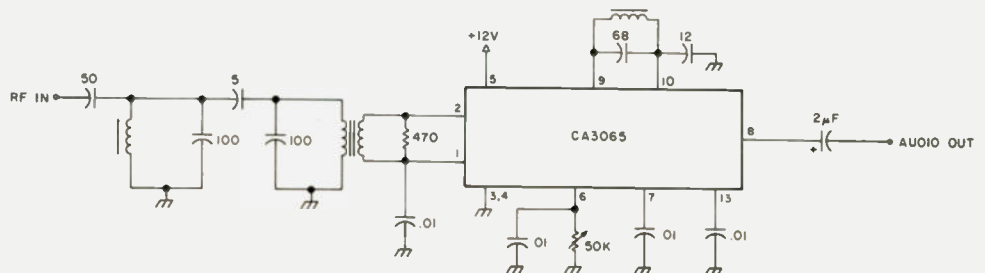

Fig. 3. A typical FM subcarrier decoder. The tuned circuits are adjusted to resonate at the desired frequency. Additional prefiltering may be necessary for best quality. Pin 6 can be grounded for maximum output.

of infinite cleverness or wisdom you may enjoy when you recycle useless junk!

The Universal Circuit

Or you can build a fixed-frequency detector. The most popular circuit in use today is one using a single IC. Known by such names as the LM3065, CA3065, or MC1358, this simple chip is nothing more than a quadrature detector which forms the guts for most TV-set sound circuits. See Fig. 3. The subcarrier feeds a bandpass filter tuned to the appropriate frequency which in turn feeds the chip for detection and de-emphasis.

Deep in its heart of darkness, the chip amplifies the signal into limiting before it is detected. In addition, the chip also contains an electronic attenuator and an output driver amp. A variable resistor from pin 6 to ground controls the electronic attenuator. Minimum resistance gives maximum volume. The distortion specs on the amp are not too sweet so it is best ignored. Besides, you can get nearly 0 dBm out of the bare detector, anyway—more than enough to ionize the plastic transistors in any amplifier.

You can build one of these detectors in an evening, but there is a better way. Buy it already built! As I've mentioned before, regular TV sound detectors are just about the same thing, circuitwise, except that they are tuned to 4.5 MHz. They differ from satellite audio ever so slightly in frequency, de-emphasis, and bandwidth. Interestingly enough, the entire sound section for an RCA XL-100 TV contains just such a circuit on the small PC card seen in Fig. 4.

Build It Quick and Dirty

The XL-100 sound modules are available at most

TV distributors. They cost about 15 dollars and are a bargain when you consider what your time is worth these days to build one from scratch. Order an RCA part number MAA001A.

The units come tuned to 4.5 MHz for TV sound. Just a few mods will make them tunable from 5 MHz to nearly 8 MHz. Change the value of C290 to 50 pF. Also change C295 to 25 pF. This will shift the unit from 4.5 MHz to about 6.5 MHz. Then solder a .01- μ F capacitor from pin 13 on the chip to a ground trace. This sets the de-emphasis to 75 μ sec.

Build a well-regulated supply the easy way by using a molded plug-in dc charger/power supply connected to a large-value capacitor and a 3-terminal regulator as seen in Fig. 5. Just be sure to include the capacitor on the output of the regulator or it will quickly lose its cool in the worst way.

Everything should fit into a small 2 \times 5 box even if you use a soldering gun rather than a pencil iron. See Fig. 6 for an idea on layout. Use whatever connectors you have in your junk box. Nothing is critical except for the mandatory use of coax from the receiver to the unit. The tap-off in the receiver is simply the same place the other sound detectors connect, usually right after video detection.

Tune-up is easy. Use your ear and twist T299 and L299 until you hear sound. A bet-

Fig. 4. Known by TV servicemen as the PM200, this small card holds nearly an entire TV-set sound section. It's a natural for cheap satellite audio recovery.

ter way is to feed your signal generator into the unit while looking at pin 9 on the chip with a scope. Once you see rf, back down the generator below limiting (done by the chip) and peak T299 and L299 for the frequency you want. If you can frequency-modulate the generator, by all means do so and set it for ± 75 -kHz deviation. Then look at the demodulated audio and adjust L299 for the best waveform. A THD analyzer can be used to improve the distortion specs with a variable resistor in parallel with C295 and L299 to lower the Q.

Next, align the bandpass-filter coils simply by peaking. You may not need the coils at all depending on the prefiltering done in the receiver. The ideal coil adjustment method is to first peak everything including L299. Then short the second coil with a 10-Ohm resistor

(you'll need more umph from the rf generator) and peak again. Remove the resistor, back down the generator, and re-peak the second coil.

Bells, Whistles, and Distortion

If the subcarrier decoder is intended as a TV sound detector, you'd better leave the 50k volume-control pot in the circuit so that you can adjust audio drive to a subsequent rf remodulator. If you are feeding another amp, you could just as well forget the pot by grounding pin 10 on the board (pin 6 on the chip). This will set the output at maximum, about 0 dBm across 600 Ohms using a 12- to 16-volt supply.

You can save in the amplifier department, too. The amplifier for an RCA XL-100 is also available. Order MAN002A and use the circuit in Fig. 7 for intercon-

Fig. 5. The PM200 becomes an FM subcarrier decoder with three mods and a few external parts. Use your ear or an rf signal generator to tweak it into operation. Forget the input bandpass network if the receiver already has a high-pass filter for subcarriers.

Fig. 6. Everything but the charger/dc supply should fit in a small box. The PC board already has a hole in it for 6/32 hardware. Mount it on a fiber or plastic standoff.

nection. You'll need a nominal 24 to 26 V dc supply at slightly more than an Amp. Don't expect very hi-fi sound at all.

Subcarrier hunting can be fun. I've discovered some really weird stuff as I dial up and down the band. The list of sources in Table 1 is a good start. So is this project when it comes to jumping into your first home-brew TVRO gadget. Because so many subcarrier frequencies are used,

you almost always can use another decoder. We've just scratched the surface of what soon will become that "big database in the sky."

The time is right for you to join in the fun of receiving TV from space. If you have a question regarding the topics we cover here, feel free to drop me a line (letters only, no calls please). Sorry, I can only answer mail that is accompanied by a SASE. ■

JUST A FEW OF THE MANY SUBCARRIERS ON SATCOMS 1 AND 3R

Transponder	Subcarrier	Program
3 WGN	5.58/5.76	SMN Pop Music Network L & R stereo
	5.94/6.12	SMN Country Music Network L & R stereo
	6.30/6.48	WFMT fine music L & R stereo
	7.695	Seeburg lifestyle music mono
6 WTBS	6.2	UPI Newstime pic and audio slow scan
	7.4	Woman's Channel pic and audio slow scan
	7.4	JISAL easy-listening music
8 CBN	5.58/5.76	Adult contemporary music EST L & R stereo
	5.94/6.12	Adult contemporary music CST L & R stereo
	6.30/6.48	Adult contemporary music PST L & R stereo
	7.56	News
11 MTV	5.80/6.62	Music Television Pop Rock L - R & L + R stereo

Or listen to what Bob Cooper calls "Good Morning Siberia" on the Russian polar orbit Molniya birds. Look for a signal near 3895 MHz (transponder 10). Then tune your subcarrier detector to 7.5 MHz for an earful!

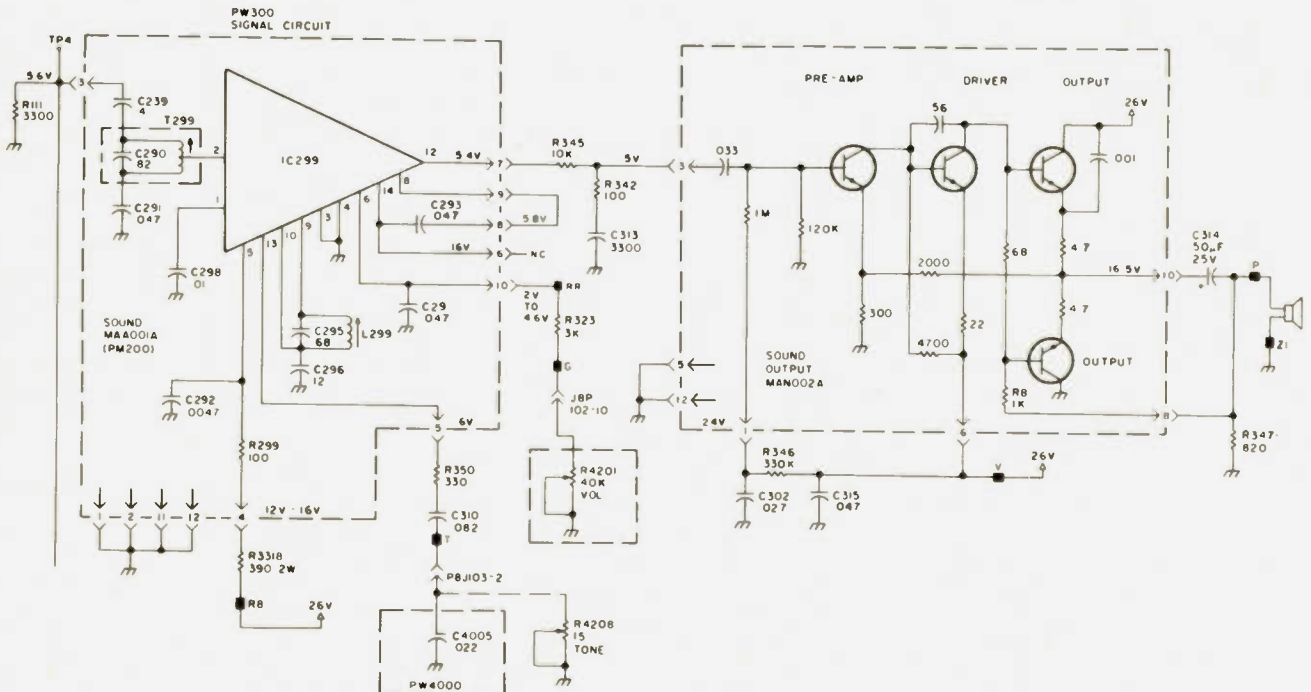

Fig. 7. The PM200 with its companion audio amp form the entire sound section for an RCA XL-100 TV . . . and a cheapo satellite receiver! Don't expect anything but soup-can quality. Your best bet is to skip the XL-100 power amp and simply feed pin 8 on the PM200 through a blocking capacitor to a good amplifier.

Your own satellite TV system for \$2,586.⁰⁰

10 FT. PARABOLIC

What the system will do:

You can receive up to 60 channels of T.V. direct from satellites to your home receiver. Movies, sporting events, religious programs, other T.V. stations, and much more.

What the system includes:

1. 10 ft. fiberglass dish made of reflective metal bond with fiberglass. Weather-resistant and virtually maintenance-free. Dish comes in 4 sections.
2. Single pedestal heavy duty polar mount for extra strength and installation simplicity; easy satellite to satellite adjustment.
3. Four pole rotator mount for more stability, square tube legs and rotator included.
4. All aluminum LNA mount and horn holder for accurate aiming of LNA. All aluminum, weather-proof LNA cover.
5. Drake ESR-24 Receiver or Auto-Tech Receiver. Your choice. Down converter located at the dish.
6. Amplifa or Avantek LNA 120°.
7. Chapparel Feed Horn for unsurpassed quality.
8. All accessories included.

Omni-Gain: A Collinear for 70 and 23 Cm

— coax comes alive

Mike Collis WA6SVT
7808 Danvers Street
Downey CA 90240

This antenna is a coaxial collinear with 9 dB gain over a dipole. The pattern is omnidirectional and works well for both ATV and FM service. While building the Mount Wilson ATV repeater, I explored an antenna system that would give omnidirectional coverage and have as much gain as was practicably available. Another consideration was en-

vironmental problems such as extremes of temperature and icing.

Commercially-manufactured antennas are available for the 432-MHz band even though their price tags are high. There are no commercially-manufactured gain vertical antennas for the 1241-MHz band. I needed antennas for both the repeater input of 434 MHz and the output of 1241 MHz; since I did not want to spend a bundle on the 432-MHz antenna, I decided to home-brew it.

The antenna is in the collinear family with its elements made of RG-213 coax stacked one on top of the

other. The main elements are $\frac{1}{2}$ wavelength and can be calculated from the formula 5904 divided by the frequency in megahertz (equals element length in inches). The next step is to find the velocity factor of the coax that will be used. I chose RG-213 as it has a good tight shield and a constant velocity throughout its length. RG-8A/U can also be used as long as it has a solid dielectric and tight-knit shield.

The last step is to multiply the element length by the velocity factor (.66 for RG-213) to yield the actual length; in this case, 8.9 inches for 434 MHz. This

formula can be used for any frequency and coax.

Elements are transposed-connected at the end of the half-wave elements so that the phase of the signal is 180 degrees out of phase from the other end of the element. See Fig. 1. As the signal travels up the elements, less signal reaches the top because of radiation, so more elements are used to get the same gain, as with stacked dipoles but without the complicated phasing harness. A quarter-wave element is used at the top and bottom of the array to match the 52-Ohm feedline at the bottom and the whip at the top of the antenna.

If 6 dB is desired, 8 elements can be used, and 16 are used for 9 dB. A slight downtilt of the pattern can be obtained by cutting the elements three percent shorter. (Downtilt is desirable if the antenna is to be installed on a mountaintop.) Any small amount of vswr can be minimized by the quarter-wave stub and trimmer capacitor in

Fig. 1. Coax connection.

	Calculated Length	
	434 MHz	1250 MHz
$\frac{1}{4}\lambda$ whip	6 $\frac{3}{4}$ "	2 $\frac{1}{3}$ "
$\frac{1}{4}\lambda$ element	4 $\frac{1}{2}$ "	1 $\frac{1}{2}$ "
$\frac{1}{2}\lambda$ element	8-7/8"	3"

Fig. 2. Coax preparation.

the matching decoupling section.

Construction

Add one half inch to the calculated length to allow for exposing the center conductor so it can be connected to the other element. See Fig. 2. Cut the jacket, shield, and dielectric with one cut. A sharp knife or X-acto® miter saw should be used to make the cut. After all the elements are cut to length, then cut the jacket back three-eighths of an inch and tin both the center conductor and shield using a 25-Watt iron—too much heat will melt the dielectric.

Now that all parts are tinned, solder the parts together with a maximum of one-eighth-inch separation between elements. After completion, check for shorts by visual inspection as the antenna is at dc ground. Excess flux should be scraped off, but do not use any chemical flux remover as it can contaminate the dielectric. The whip on the top is connected to both the center and shield. The matching section is a quarter-wave coax stub shorted at both ends and a piston trimmer capacitor. See Fig. 3.

Tune-Up

Adjust the trimmer for minimum vswr. If the minimum is at one end of the trimmer, then adjust the spacing of the stub to feedline distance. One-eighth inch is normal for the spacing.

Housing

The antenna is housed in PVC pipe. The heavy wall is the one to use and it is also known as schedule 40 PVC. One-inch diameter can be used for either the 1241-MHz model or the 434 model, but if the antenna is to be mounted as a free-standing antenna, the 434-MHz housing should be tapered. This can be done with 3/4-

Fig. 3. 8 elements = 6 dB. 16 elements = 9 dB.

inch, 1-inch, and 1 1/4-inch pipe. The pipe may need to be heated to make a better fit. Pipe caps are used to keep the rain out of the housing and the bottom should be open so it can breathe. The antenna can be mounted one half wavelength from a mast for a cardioid pattern and the gain will increase 2 dB over that of an omnidirectional pattern. See Fig. 4 for the patterns.

Conclusions

Construction time is one to two evenings. Take your time and you will have a better working antenna. The 434-MHz version has been in use for one year now on Mount Wilson and has survived all four seasons from 100 degrees heat to snow and ice. Many of these particular antennas in Los Angeles and San Diego have been built and used with the same results as I have obtained. Recently, a second 1241-MHz version was installed on Mount Wilson for the aural transmitter on the ATV repeater. It is

Fig. 4. (a) Omnidirectional pattern. (b) Cardioid pattern.

and the results have been good.

Acknowledgements

I would like to thank Jay N6BDT for his help in testing the antenna, and also all others who helped me in this endeavor. ■

identical to the one used for the visual transmitter

Introducing A Whole New World Of Capability For Your Repeater . . .

- FLEXIBILITY, SECURITY - Remote configurability with non-volatile storage of command codes, ID and tail messages, tone characteristics, timing, and more
- QUICK, EASY, SECURE AUTOPATCH - Store/forward patch plus two autodialers
- FLEXIBLE LINKING - Supports synthesized remote bases
- VOICE RESPONSE TELEMETRY - Meter readback with natural sounding synthesized speech lets you monitor your site, gives users diagnostic information about their signals
- SOUNDS GREAT! - Audio processing with delay line to mute squelch tail and tones
- GROWTH POTENTIAL - Expandable, upgradable to preserve your investment
- LOW POWER . . . EASY TO INTERFACE . . . AND MUCH, MUCH MORE!

Mini-Terminal™ suggested price \$299.95

All in one package—CW, RTTY, ASCII send/receive and hard copy capability for under \$300. Unbelievable, but true! Again, Kantronics puts all the features you want in a single unit: The Kantronics Mini-Terminal™.

You send CW with your key or keyboard, and the Mini-Terminal™ converts to RTTY or ASCII. Mini-Terminal™ also reads all incoming CW, RTTY, and ASCII messages and reads out on a bright green 10-digit display. For hard copy simply attach any Centronix compatible printer, such as the Epson MX-80 or the Paper Tiger, and watch the Mini-Terminal™ do the rest.

A complete code reader and RTTY terminal, with printer compatibility all in one package only 2½"x5"x5¼". Get all you can for your dollar; get the Kantronics Mini-Terminal™.

Fighting Air Pollution

— why you need a tuner

Bob Rooney W2AET
PO Box 5
Fulton NY 13069

You have broadband dipoles for 80 and 40 meters and a versatile tribander for 10, 15, and 20. All show a nice 1:1 swr at your transmitter's output. No need for one of those bulky outboard rf matching units, right? Don't answer yet. You may change your mind after reading this review of the family of rf matching devices known by a variety of names including transmatches, couplers, and antenna tuners.

The primary purpose of an rf matching unit is to ensure that the output of the transmitter (transceiver, amplifier, receiver) looks into its design output impedance, usually 50 Ohms in today's equipment. The matching units available today can transform complex impedances as high as several hundred and often as low as ten or twenty Ohms into the 50-Ohm resistive load that the radio was designed for. But there are other reasons for using an rf matching unit. These additional benefits will improve your station's operation

even if your rig is already working into a perfect match.

Rf matching units often provide increased attenuation of harmonics and spurious signals due to additional circuit Q and the filtering action of many types of matching networks. The degree of this benefit depends on the type of matching network employed, so let's quickly review the popular types available from manufac-

turers and described in handbooks.

Network Types

The L-network (Fig. 1) makes up the simplest type of matching unit, consisting of a variable capacitor and a tapped coil. It may be used in combination with a pi-network to form a most effective pi-L matching network. The L-network alone is frequently employed in the simplest and least expensive matching units. The range of

*Don't hook-up
your coax
without one!*

Models
R-T,
HV

Protects sensitive solid state components in your equipment from high-surge voltages produced by nearby lightning strikes, high wind, and static build-up. Even distant storm fronts are known to cause damaging surges without warning or time for grounding.

The replaceable Arc-Plug™ cartridge, which can fire thousands of times, utilizes a special ceramic gas-filled tube with precisely tailored firing speed and level, safely by-passing surges to ground. Standard air-gap devices are ineffective due to their erratic performance.

Transi-Trap Protectors are the first devices in the industry designed with "isolated ground." This keeps damaging arc energy off the chassis and routes it directly to ground.

Models Available: (50 ohms, 200 W models are most sensitive, best for RCVRs and XCVR's. 2 kW models designed for amps. All models include Arc-Plug cartridge.)

MFJ SHORTWAVE ACCESSORIES

NEW Indoor Tuned Active Antenna. Rivals, can even exceed reception of outside long wire.

Rivals long wires

\$79⁹⁵

MFJ-1020 NEW INDOOR ACTIVE ANTENNA sits on your desk ready to listen to the world. Rivals, can often exceed, reception of outside long wire. Unique Tuned Active Antenna minimizes intermod, provides RF selectivity, reduces noise outside tuned band. Also use as preselector for external antenna. Covers 300 KHz to 30 MHz in five bands. Adjustable telescoping antenna. Controls: Tune, Band Selector, Gain, On-Off/Bypass, LED, FET, bipolar circuitry. Phono jack for external ant. 6x2x6 inches. 9-12 VDC or 9 V battery for portable use. 110 VAC with optional AC adapter, \$9.95.

\$99⁹⁵

MFJ-1040 RECEIVER PRESECTOR. Improves weak signal reception, rejects out-of-band signals, reduces image response, 1.8 to 54 MHz. Up to 20 db gain. Low noise MOSFET. Gain control. Bandswitch. Can use 2 ant., 2 rcvrs. ON-OFF/Bypass. 20 db attenuator. LED. Coax, phono jacks. 8x2x6 in. Also for XCVRs to 350 watts input. Auto bypass. Delay control. PTT jack. **MFJ-1045, \$69.95.** Same as MFJ-1040, less attenuator, xcvr auto bypass, delay control, PTT. Use 1 ant., 1 rcvr. 5x2x6 in. 9V bat. Both requires 9-18 VDC or 110 VAC with optional AC adapter, \$9.95.

\$89⁹⁵

MOBILE SWL CONVERTERS to hear the short-wave world while you drive. **MFJ-304 (\$69.95)** covers 19, 25, 31, 49 meter bands. **MFJ-308 (\$89.95)** adds 13, 16, 41, 60 meters. Two dual-gate MOSFETS give excellent sensitivity, selectivity with car receiver. Push button band selector. Tune with car radio. Plugs between antenna and radio. 12 VDC. **304** is 5 1/4 x 1 1/4 x 4". **308** is 6 1/4 x 1 1/4 x 5". **Free catalog.**

MFJ-10, 3 foot coax with connectors, \$4.95.

Photo B. Tube-type kilowatt at 3.5 MHz without rf matching unit.

Photo C. Solid-state exciter driving kilowatt amplifier at 3.5 MHz without rf matching unit.

impedances it can match is limited.

The pi-network (Fig. 2) is the same network used at the output of many modern transmitters' final amplifier stages. Such a network external to the transmitter can be added to provide increased matching capability. The common pi-network will include two variable capacitors working against ground and a tapped, series coil. This type of arrangement has the network acting as a low-pass filter that serves to reduce harmonic output. An example of a matching unit using the pi-network in this way is the

Drake MN-2700.

The T-network (Fig. 3) usually will consist of a combination of two variable capacitors on each side of a large tapped coil. This network can match a very wide range of impedances but may not provide significant harmonic attenuation under some circumstances. Examples of the T-network include the famous "Ultimate Transmatch" and many commercial models available from a host of manufacturers, including the Dentron MT-3000.

Inductive coupling (Fig. 4), consisting of two coils air-coupled together and

associated capacitors for tuning, allows a matching unit to function as a band-pass-type filter showing modest attenuation of frequencies above and below the operating band. A classic example of this type of unit is the Johnson Matchbox.

Test Results

Now let's take a look at some of these matching units in action in situations where a 1:1 match already exists between antenna and transmitter.

Photo A is the display on a spectrum analyzer showing a modern-design, solid-

state QRP transmitter delivering two Watts at 3.5 MHz to a dummy load. Starting at the left (the high vertical peak along the border is the analyzer reference signal and is to be disregarded), each horizontal scale division is set for two megahertz and each vertical division is 10 dB. A third harmonic can be seen down about 35 dB just past center scale at 10.5 MHz. Up further, what appears to be the fifth harmonic is attenuated just a bit more. Below the fundamental are spurious signals appearing in the broadcast band (-31 dB) and in the

Photo D. Same equipment as in Photo C but with the addition of antenna matching unit.

Photo E. Solid-state transmitter at 21.1 MHz without antenna matching unit.

MFJ KEYERS

Uses Curtis 8044 IC. Iambic operation, dot-dash memories, weight control, solid state keying. RF proof.

\$79⁹⁵

The MFJ-408 Deluxe Electronic Keyer sends iambic, automatic, semi-automatic, manual. Use squeeze, single lever or straight key.

Speedmeter lets you read speed to 100 WPM. **Socket for external Curtis memory**, random code generator, keyboard. Optional cable, \$4.95. **Iambic operation** with squeeze key. Dot dash insertion. **Semi-automatic "bug" operation** provides automatic dots and manual dashes.

Dot-dash memory, self-completing dots and dashes, jam-proof spacing, instant start. **RF proof. Solid-state keying:** grid block, solid state xmtrs.

Front panel controls: linear speed, weight, tone, volume, function switch. 8 to 50 WPM.

Weight control adjusts dot-dash space ratio; makes your signal distinctive to penetrate ORM.

Tone control. Speaker. Ideal for classroom. **Function switch** selects off, on, semi-automatic/manual, tune. Tune keys transmitter for tuning.

Uses 4 C-cells. 2.5 mm jack for power (6.9 VDC). Optional AC adapter MFJ-1305, \$9.95.

Eggshell white, walnut sides. 8x2x6 inches. **MFJ-406, \$69.95,** like 408 less speedmeter.

\$49⁹⁵

New MFJ-401 Econo Keyer II gives you a reliable, full feature economy keyer for squeeze, single lever or straight key.

Has sidetone, speaker, volume, speed, internal weight and tone controls. Sends iambic, automatic, semi-automatic, manual. Tune function. Dot-dash memories. 8-50 WPM. "On" LED. Use 9V battery, 6.9 VDC, or 110 VAC with optional AC adapter, MFJ 1305, \$9.95. 4x2x3 1/2".

Reliable solid state keying. Keys virtually all solid state or tube type transmitters.

\$64⁹⁵

MFJ-405 Econo Keyer II. Same as MFJ-401 but has built-in single paddle with adjustable travel. Also jack for external paddle. 4x2x3 1/2".

Optional: Bencher Iambic Paddle, \$42.95; 110VAC adapter, MFJ-1305, \$9.95. **Free catalog.**

Order from MFJ and try it. If not delighted, return within 30 days for refund (less shipping).

Photo F. Rf matching unit with T-network added to the equipment used in Photo E.

Photo G. Rf matching unit employing pi-network instead of T-network, with the Photo E equipment.

160-meter band (-38 dB). No rf matching unit is in the circuit. If it were not for the low power level of this transmitter, it wouldn't meet today's FCC rules for attenuation of spurious and harmonic emissions.

Photo B shows a twenty-year-old tube-type transceiver operating at the same frequency and driving a similar vintage kilowatt amplifier for 600 Watts output. Notice the second harmonic near 7 MHz down about 40 dB, and the third harmonic down almost 60 dB. Of course, the fundamental is about 25 dB stronger than the same sig-

nal generated by the QRP rig. Again, no external rf matching unit is used.

Photo C shows the spectrum produced by one of today's higher-priced solid-state rigs driving a modern kilowatt amplifier to 600 Watts output on the same frequency. Note that the harmonics have been further reduced but spurious signals, generated by the solid-state transceiver, are present below the fundamental. Although these spurious signals are down about 60 dB, there may still be the potential here for BCI in neighborhood radios.

Photo D shows the result

of adding an antenna tuner to the transmitter/amplifier combination in Photo C. An already clean signal has been made "sparkling clean" by still further reduction of harmonics and spurious signals. The result is less spurious signal being radiated by the kilowatt station (with antenna matching unit) than by the QRP station (without antenna matching unit). All equipment was connected to a 50-Ohm dummy load so that in all cases the swr was 1:1, with or without the matching unit.

In Photo E we see a partial spectral display of a

QRP solid-state transceiver operating into a dummy load on 21.1 MHz. The horizontal divisions on the analyzer are now 5 megahertz each with the vertical scale remaining at 10 dB per division. Around 42 MHz is a second harmonic down about 30 dB, with a third harmonic down 38 dB and a large assortment of more significant spurious signals between 15 and 40 MHz, down 38 to 45 dB. There is no matching unit at the output of the transceiver.

Photo F shows the result of adding a popular antenna tuner incorporating a T-matching network. A dif-

Photo H. Solid-state QRP transceiver operating at 29 MHz without rf matching unit.

Photo I. Pi-network rf matching unit added to output of the transmitter used in Photo H.

BARKER & WILLIAMSON

VERTICAL ANTENNAS

MODEL 370-31

Slim Line Vertical designed for 10, 15, 20 and 40 meters. All traps pre-tuned. Overall height 21 feet. Can be used with or without ground radials. Model 370-33 — 75 meter add on kit. 75 and 80 meter operation optional with model 370-33 add on kit. Power rating 1 KW-2 KW P.E.P.

MODEL 370-30

Economy model vertical for 10, 15, 20 and 40 meter operation. High Q factory tuned traps. Overall height 21 feet. Can be used with or without ground radials. Model 370-32 — 75 meter add on kit. 75 and 80 meter operation optional with model 370-32 add on kit. Power rating 1 KW-2 KW P.E.P.

MODEL 370-34

Radial Kit. Radial Kit for Models 370-30 and 370-31 Vertical antennas. All necessary wire and hardware for two ground plane radials. Write for more details and other antenna products.

MFJ SWR/WATTMETERS

MFJ HF SWR/Wattmeter reads SWR, forward, reflected power from 1.8-30 MHz.

\$49⁹⁵

MFJ-814

New low cost in-line HF SWR/Wattmeter. MFJ-814 lets you monitor SWR, forward, reflected average power in 2 ranges from 1.8 to 30 MHz. Read 200/2000 watts forward. 20/200 watts reflected power. SWR, 1:1-6:1.

Easy push-button switch operation: has power/SWR, high/low range, forward/reflected push-button switches. SWR sensitivity control.

Lighted meter (requires 12V). Rugged aluminum eggshell white, black cabinet. 6 1/4 x 3 1/4 x 4 1/4". SO 239 coax connectors, 2 color meter scale.

MFJ VHF SWR/Wattmeter/Field Strength Meters

\$29⁹⁵

MFJ-812

New low cost VHF operating aids. MFJ-812, \$29.95: Read SWR from 14 to 170 MHz to monitor antenna and feedlines.

Read forward and reflected power at 2 meters (144-148 MHz). 2 scales (30 and 300 watts).

Read relative field strength from 1 to 170 MHz. Binding post for field strength antenna.

Easy push-button operation: has forward/reflected and SWR/field strength push-buttons.

Aluminum eggshell white, black cabinet. 4 1/4 x 2 1/4 x 2 3/4". SO 239. 2 color meter scale.

MFJ-810, \$24.95: similar to MFJ-812 less field strength function.

MFJ "Dry" 300 W and 1 KW Dummy Loads.

\$64⁹⁵

MFJ-262

\$26⁹⁵

MFJ-260

Air cooled, non-inductive 50 ohm resistor in perforated metal housing with SO 239 connectors. Full load for 30 seconds, de-rating curves to 5 minutes. MFJ-260 (300 W). SWR: 1:1 to 30 MHz. 1.5:1 for 30-160 MHz. 2 1/2 x 2 1/2 x 7". MFJ-262 (1KW). SWR: 1.5:1-30 MHz. 3 x 3 x 13".

MFJ-10, 3 foot coax with connectors, \$4.95

ferent distribution of spurious signals results, but no significant improvement.

In Photo G, we see the results of substituting an antenna tuner with a pi-network. Notice how this unit functions as a low-pass filter, greatly attenuating spurious signals above about 24 MHz.

Photo H shows a close-in view of a 29-MHz signal peaked at the center of the display with each horizontal division equaling 1 megahertz. Spurious signals are shown at 27 MHz (-42 dB) and at 27.5, 30.5, and 31 MHz.

In Photo I, the addition of a pi-network matching unit shows about an 8-dB average reduction in the close-in spurious signals. (The higher harmonics such as 58 MHz and above have been practically eliminated but are not shown in this picture.) Without the matching unit's effect, this 8-dB reduction in the

strength of the spurs would have been achieved only by the reduction of the main transmitting power from, say, 100 Watts to about 16 Watts.

There are, of course, tuner trade-offs for the additional benefits provided by the matching units. Some power is lost in the matching unit, but if large-size, good-quality components are used in a unit's construction, these losses can be held at a few percent or a fraction of a dB. For portable operation, the additional bulk of another unit is a consideration, and with solid-state rigs the need to do some tuning is another factor.

The result is always a cleaner signal, however. When the amateur station is running a kilowatt, even a spur attenuated 40 dB can cause problems. In all cases, a matching unit is a good tool to control air pollution in the radio spectrum. ■

How to locate & cure RADIO FREQUENCY INTERFERENCE

TVI — stereo — radio
power line — telephone
CATV — computer

“Covers RFI from A to Z - a tremendous help”
— Senator Barry Goldwater, K7UGA

This timely handbook covers every type of RFI problem and gives you the solutions based on practical experience. Covers interference to TV, hi-fi, radio, telephone, amateur, commercial and CB equipment. Power line interference explained in detail: how to locate and cure it, safety precautions, etc. Gives home, business, industrial RFI sources; mobile RFI; AC/RF grounds; radials; CATV and computer RFI; filters.

Written by an RFI expert with 33 years' experience, this well illustrated book is packed with practical solutions. Sold by the best dealers world-wide. Get your copy! On orders to publisher, please add \$1 postage/handling. Write for free literature.

Americanizing the German Quad

— the world's best antenna?

One beautiful day in June over three years ago, Joe W3LDV came over to my house, as he often does, only this time he had a special purpose.

"Hey, you love antennas! Have you read about this one in the latest issue of 73?"

Having a 100-foot tower with a tribander and phased two-meter arrays, plus inverted vees and various slopers (not to mention a Mor-Gain folded dipole), I did not need any new antennas on my farm!

Such being the case, my response was "What kind is it? Have you tried it? Have I got enough room? Let's try it anyway!"

He produced the June,

1978, issue of 73 Magazine and we got down to a serious discussion over cups of coffee.

This article was written by Christof Janker WD4CPK/DF3TJ of West Germany. He described a big quad that was mounted parallel to the earth and which was usable on all bands. The results he showed were almost phenomenal. His quad rivaled, yes, excelled, a two-element yagi beam. Joe, an active ham for many years and certainly longer than I have been, explained that by the appearance of this design there was much promise to its operational characteristics. We set about to get halyards into appropriately spaced trees.

Double-checking with the formula, $L(\text{feet}) = 1005/F$ (MHz), Joe and I erected a 69-foot-per-leg fairly square quad as described in Mr. Janker's article, using THHN insulated 7-stranded, 14-gauge wire, and fed it with a random length of 75-Ohm coax. We used plastic insulators on the four corners, tied our halyards to each of these, and pulled the antenna up (see Fig. 1). It was fairly square, but we found out that this is not critical. For horizontal

polarization, we selected the feedpoint off one corner, according to its earth parallel elevation. The math said that this antenna would have its center resonant frequency at 3.6 MHz, and it did, with no further ado! At this happy point, we decided to do some listening and comparing to my other antennas. All comparisons were done against the following:

- 1) Inverted vees (80 and 40), apex at 90 feet, fed from common coax.
- 2) Mor-Gain folded dipole at 60 feet.
- 3) A 40-meter sloper, highest end at 90 feet.
- 4) An endfed Hertz (130 feet long) with coupler at 40 feet.
- 5) An 80-meter dipole at 30 feet.
- 6) A Mosley Classic 33 on top of my tower at 100 feet.

It took Joe and me about five minutes to determine that this thing showed superior receive quality to all of the above except the beam! Swr was perfect for 80 CW and 40 phone just the way it stood. Contrary to Mr. Janker's statement, all other bands presented a very high swr without the use of a coupler except for one. The unique feature was that the noise level was

dramatically less on the quad than on any of the other test antennas. My shack is plagued with nighttime noise levels of an uninteresting degree due to local residents involved in welding, grinding, and other "anti-receiver" hobbies. When we switched on the quad, signals dramatically quiet were unintelligible on the other wires.

Transmitting tests showed a constant three S-units better report on the quad on 80 and 40 than on any of the other antennas (not counting the beam, of course). As Mr. Janker pointed out in his article, there appeared to be no directivity exhibited on either band, even though the antenna is two full wavelengths long on 40 meters.

We then shortened the German quad to center resonate at 3.9 MHz in order to try 75 phone, and all results were identical to the above, with one sad note: This length made all the remaining bands useless without a tuner. But the use of one provided the same happiness as before—excellent reports all the way around the spectrum, beating everything except the Mosley. The beam had about six S-units on the quad on 10,

Fig. 1. Basic construction of horizontal quad.

TRS-80* I, III OWNERS:

Send and receive CW with MFJ's new CW transceive program and interface. Just plug-in interface, load program and operate. Gives you Tri-Split screen, 3295 character buffer, 10 memories, "Fist Fixer."

All you need to
send and receive CW.

\$99⁹⁵

*TRS 80 is a registered trade mark of Tandy Corporation

TRS-80 Models I and III CW Transceive program and interface lets you send and receive CW. No modifications to rig or computer.

Tri-Split screen for receive, transmit, message index. On screen transmit/receive "LEDs", transmit speed indicator, "Fist Fixer."

TRANSMIT: 3295 character (or more) buffer. Preload buffer while receiving. Transmit when ready. Ten 199 character memories. Repeat/link memories. Erase character, buffer, screen. 12-55 WPM. Store 2200 characters for group practice.

RECEIVE: Adjustable "Fist Fixer" helps to copy poorly sent CW. Self-adjusting to 100 WPM. Returns to receive when transmit buffer is empty. Store up to 5 screens of received CW.

HARDWARE INTERFACE: Plugs between rig and computer. Noise limiter, 4 pole active bandpass filter, post detection filter, tracking comparator. Keys tube or solid state rigs. Tuning, transmit, ON LEDs. 6x1 $\frac{3}{4}$ x3 inches. Aluminum cabinet.

RF shielded. 9-18 VDC or 110 VAC with optional MFJ-1312 AC adapter, \$9.95.

Requires TRS-80 Model I or III with at least 16K. Program supplied on cassette tape.

Order from MFJ — no obligation. If not delighted, return within 30 days for refund (less shipping). One year unconditional hardware guarantee.

Order today. Call toll free 800-647-1800. Charge VISA, MC or mail check, money order for \$99.95 plus \$4.00 shipping and handling. Order MFJ-1210 for TRS-80 Model I or MFJ-1212 for Model III.

Enjoy CW. See dealer or call MFJ today.

EARTH STATION OWNERS & DEALERS:

You've got terrestrial interference... We've got filters!

The concrete under your new earth station isn't hard yet, but you've got trouble already—unwanted microwave signals are destroying your picture. Your customer is throwing tantrums, and you have two choices: Tear it down and eat the installation costs, or filter it.

We can help. Call us and we'll send you MTV/82, which tells how to eliminate terrestrial interference on earth stations and lists a complete line of filters designed and tested for this purpose. Created for effective use by novice and experienced earth station operators alike, MTV/82 explains each type of interference, describes the symptoms and recommends specific filters to solve your specific problems.

- microwave & IF bandpass filters
- IF traps
- waveguide adapters
- power dividers
- coax adapters
- specials!

Products include:

Call or write today and we'll also send you FG/82, "Earth Stations & Terrestrial Interference: A Filtering Guide for the Installing Dealer."

Ducks are getting smaller!
and...

better!

Because you and the leading radio manufacturers want the best-performing, the best looking antenna; Centurion has grown to be the Duck leader. We've developed many smaller antennas to make the hand-held radio perform better, and now the newest duck...the Tuf Duck "mini". It's shorter (about 3") yet it's a full 1/4 wave radiator on VHF.

NEW MFJ-102 SOLID STATE 24 HOUR DIGITAL CLOCK

Switchable to 24 hour GMT or 12 hour format. ID timer. Seconds readout. Bright BLUE .6" digits. Alarm, snooze, lock functions. Power out, alarm on indicators. Assembled.

Switch to 24 hour GMT
or 12 hour format!
ID timer. Seconds readout.
Bright BLUE .6 inch digits.

\$32.95

Now you can switch to either 24 hour GMT time or 12 hour format! Double usefulness.

Switchable "Seconds" readout for accuracy. ID timer. Alerts every 9 minutes after you tap the button. Also use as snooze alarm.

"Observed" timer. Just start clock from zero and note end time of event up to 24 hours.

Alarm. For skeds reminder or wake-up use. Synchronizable with WWV.

Fast/Slow set buttons for easy setting.

Big, bright, blue digits (vacuum fluorescent) are 0.6" for easy-on-the-eyes, across-the-room viewing.

Lock function prevents missetting.

Operates on 110 VAC, 60 Hz (50 Hz with simple modification). UL approved.

Handsome styling with rugged black plastic case with brushed aluminum top and front.

Sloping front for easy viewing. 6x2x3".

Order from MFJ and try it — no obligation. If not delighted, return it within 30 days for refund (less shipping). One year limited warranty by MFJ.

Order today. Call toll free 800-647-1800. Charge VISA, MC or mail check, money order for \$32.95 plus \$4.00 shipping/handling for MFJ-102.

Put this new improved MFJ digital clock to work in your shack. Order today.

138.62	141.55	34.65	1.5

Table 1. Full-size quad dimensions for 80 and 40.

15, and 20. (It better have, with the total cost of the beam, tower, thrust bearing, rotor, and accessories needed to use it including 190 feet of half-inch hard-line tipping the 2000-dollar figure compared to about 15 dollars worth of wire and coax!)

Now came the clincher. Joe mused, "It's too bad the thing will not operate satisfactorily on all or most bands without a tuner. With all the buttons and switches at your shack, Rich, a tuner would drive you nuts."

His observation was sadly true. I have spent a great deal of time building all my "junque" behind wood panels, and my brand of operation would be greatly hampered by such an accessory. This situation was basically also true for Joe. Seems that neither of us was satisfied to just stand our equipment on desks where troubleshooting and disconnecting would be easy!

We finished that long Saturday, satisfied that this German fellow was terrific for 80 CW and 40 phone with the length cut for 3.6 MHz.

Joe called me a day or so later and in sorrow explained to me that he could not make the full-sized quad fit his property, nor could he fit one cut for 40 as the lowest band. He asked if I could program my computer for some possible compromise, feeding it the swr and length measurements we had gathered and recorded (thanks to Joe's insistence). It took about two

weeks with usable spare time to get the TRS-80 to spit out a configured compromise for Joe's application—a quad 24' x 32', with 40-meter phone as the lowest usable subband. This quad had two "stubs" draping down 13 feet each, meeting the RG-59/U coax. Further possible complications were that we could raise this only 15 feet high on one end, 8 feet high on the other, and one leg ran parallel and nearly against his rain gutter! Guess what? With minimum stub trimming, the thing not only took off at 1.2:1 on 7250 and was under 2:1 on 10 and 15 as well, but it was just a bit of a problem on 20.

In the next few weeks, we both piled up reports and pleas to send the specs of the monster to numerous hams who indicated their wishes to own a copy of this performer. Joe's "little cutie" was super on 40, intriguing on 15, and devilish on 10. He had wonderful reports from far-away places that he could hardly copy on his dipoles. While my family and I were vacationing last summer in New England, I had daily contacts to home with five of my local friends, including Joe. On 40, he constantly had the superior signal to the other four on our rig in Dad's motor home. My folks and my wife, all hams as well, noted this. Dad made an appointment to have a quad erected at his place when we got home!

One day, near the end of the summer, Joe again nailed me with a challenge

which turned out to be a personal vendetta: "Do you think we could allband this thing? You don't need it with your beam, but it would be a blessing to a lot of hams who are short on real estate and whose pocketbooks cannot justify a tuner."

The antenna was so good that I could not resist trying. It is clearly the best that I have ever had the pleasure of using.

I decided that maybe one could feed the square, or "flat-top," of the antenna with different lengths of so-called stub wire much the same as several inverted-vees are fed with the same coax, assuming the rf would travel the least-resistance pathway. This is not only untrue with the quad configuration, but it also fouled up everything about the antenna, complete with lowered receive capability. I was giving it up as a bad job when Joe saved the day. He made some tests that concluded that the stub principle of my computer's origin could be the key, that coupling to these stubs in a capacitive way might yield compromise pathways to rf, and that its being a voltage-fed antenna just might allow this effect to work. I altered the computer program to make theoretical tests on the possibility. It projected swr's indicating that we might have something.

The bottom line turns out to be the following: Erect the quad with 3.9-MHz math in the flat-top. The total amount of wire should be figured for 3.55 and the difference between these two plus 60% of this difference shall drape down like tuned feeders, being spaced with a 2-3-inch constant. Altering this constant spacing does definitely affect the necessary feeder length—we chose this particular constant.

Table 1 presents con-

struction data to those who want to stop reading right now and go to work!

As depicted in Table 1, the full-sized antenna will perform superbly from 160 through 40 meters, on 10 meters, and is flat on 2! The trick (for me, at least) was what we did next. Joe and I installed a pair of auxiliary wires from the coaxial feed-point, and free-hanging on their other ends. With a little care in pruning these, 20 and 15 meters finally came into use for my touchy solid-state finals, showing about 1.6:1 swr or better on the phone subbands. This is alterable to suit your desires. These "free stubs" are about 40% of the length of the tuned feeders for starters, or about 8.2 feet. I must add that this is only valid on the 80-meter quad; the lengths for these free stubs would be too short for capacitive value on the miniature or configured versions.

So, now over three years later, we have ended up with four distinct design versions:

- 1) A tribander for 160 through 40 meters (being a half wave on 160; it radiates well).
- 2) An allbander, including 2 meters, with appropriate stubs.
- 3) A mini-quad, full wave on 40 meters, fine on 15 and 10, and still flat on 2.
- 4) A configured version, rectangular in shape, showing some directivity, good on 40, 20, 10, and 2. The configured version, I believe, will be of interest to many because of the relatively small amount of real estate necessary for its use. For a compromised setup, it seems to operate without compromise!

The general methodology for the configured, smaller-than-formula antenna, is: $L = 1005/F$, where the length of antenna in feet is equal to 1005 divided by the frequency in MHz

Introducing incredible tuning accuracy at an incredibly affordable price: The Command Series RF-3100 31-band AM/FM/SW receiver.* No other shortwave receiver brings in PLL quartz synthesized tuning and all-band digital readout for as low a price.† The tuner tracks and "locks" onto your signal, and the 5-digit display shows exactly what frequency you're on.

There are other ways the RF-3100 commands the airways: It can travel the full length of the shortwave band (that's 1.5 to 30 MHz). It eliminates interference when stations overlap by narrowing the broadcast band. It improves reception in strong signal areas with RF Gain Control. And the RF-3100 catches Morse

communications accurately with BFO Pitch Control.

Want to bring in your favorite programs without lifting a finger? Then consider the Panasonic RF-6300 8-band AM/FM/SW receiver (1.6 to 30 MHz) has microcomputerized preset pushbutton tuning, for programming 12 different broadcasts, on the same broadcast 12 days in a row. Automatically. It even has a quartz alarm clock that turns the radio on and off to play your favorite broadcasts.

The Command Series RF-3100 and RF-6300. Two more ways to roam the

globe at the speed of sound. Only from Panasonic.

*Shortwave reception will vary with antenna, weather conditions, operator's geographic location and other factors. An outside antenna may be required for maximum shortwave reception.

†Based on a comparison of suggested retail prices.

RF-6300 8-band AM FM SW

This Panasonic Command Series™ shortwave receiver brings the state of the art closer to the state of your pocketbook.

With PLL Quartz Synthesized Tuning and Digital Frequency Readout.

38 Panasonic
just slightly ahead of our time.

(this, of course, is the standard formula for the total length of any quad). $FL = 2W + 2L$; in this, the flat-top is equal to twice the available width plus twice the available length. $ST = (L - FL)/2$; each stub is equal to the total formula length minus the available flat-top length, the difference divided by two.

The configured quad should have the minimum parameter that either two parallel legs should be no shorter than 50% the length of the longer two. We also found that any measurements of available space should be at least 50% the formula length for any one side of the lowest band chosen, no matter which version is used. I must point out here that all of the above are solidly flat across the whole of that dreaded 11-meter band!

There is no negativity intended to those wonderful-when-needed boxes, the

tuners, but all the above findings were recorded without their use. We did hook my tuner to the wire, just to make sure one could be used, and had no trouble at all. One note: The miniature quad (a full wave on 40 meters) should be calculated the same way as the big one; use 7.1 (twice the 3.55 constant) in the loop formula. Then redo with 7.25, and subtract the two. The difference cut in half makes each feeder to be spaced 2-3 inches and fed with coax.

Computer Program

My program is in the hands of many hams who have asked Joe and me to please send to them the specs on the quad. Almost every query was as a result of response to these hams having been on the receiving end of our "Americanized quad." I must admit that I delight in having a ham's visit to my shack

topped off with a printout for him of his choice of quad versions.

It is for this reason that I included the program with this article. It could be shortened for simplicity, but then only the programmer could enjoy or even use it. With this, one can run off the math for various frequencies and note the resonance changes on the other bands. I have allowed for the computer to demonstrate how the swr should change if one should alter the detuning stub length for 20-15-10 operational changes.

In case there is no printer available, the program could be typed over, changing all LPRINT commands to PRINT; however, line 140 contains POKEs to select either mode almost as comfortably. Line 35 ensures the normal condition. The math in various lines calculates values for each antenna version, as outlined pre-

viously. The decimal comparisons in lines 1110 through 1550 were made from proportions calculated from our swr findings; lines 1630 through 1730 contain eleven frequencies from each band tested for swr prediction. Lines 1810 through 1990 allow heading printing; lines 2170 through 2330 print findings under correct categories depending on user selection of antenna type; and 3000 through 3200 print out the schematic of each possible design.

Neither Joe nor I profess to be any sort of expert on antenna theory. We have, however, built many antennas, and to date, we feel that this is the best and probably least-expensive antenna one can use. It has performed well on the DX bands and superlatively on the rest. Has anyone got the real estate and equipment to stick up a full-wave on top band? ■

NEW MORSEMATIC™ MM-2 KEYSER

THE MORSEMATIC KEYSER BY AEA HAS BEEN PROCLAIMED BEST OF ALL PADDLE KEYSERS ON THE MARKET

Now you can get all the features of the world's first and still best microcomputerized keyer at a 30% reduction in price. The new model MM-2 has all the outstanding features of the MM-1 predecessor such as dual microcomputers with copywritten software, 500 character soft-partitioned™ memory with editing, exclusive beacon mode, exclusive automatic speed increase trainer mode, and exclusive automatic serial number generator. In addition, the MM-2 comes complete with CMOS memory and provisions for internal memory keep alive battery. The MM-2 operates from external 12 VDC at approximately 350 Ma.

ACCESSORIES:

Model AC-1 600 Ma 12 VDC Wall Adaptor \$14.95
 Model ME-2 Memory Expansion (2000 Total Morse Characters) \$39.95

If you have hesitated buying the best because of price, you need to wait no longer, the best is now available in an improved form at a price you can afford.

24K BATTERY-BACKED MEMORY

- Write and load programs in easy to use "BASIC".
- Enter, store, replay, delete etc. individual messages remotely.
- Did you work him or not? When? etc. or use for personal station log.
- Create perfect message quality text with editing capabilities.
- Never lose your MAILBOX, station LOG, DUPE sheet or program. 24K = 24576 characters.

=

The most complete communications system available today
(or for years to come!)

With the addition of this one internal multi-function board and basic module to your ATR-6800, ALL of the above features are available, as well as the superior RTTY/CW performance in one attractive RFI PROOF package.

Factory installed for \$599, contact us for scheduling at 18713 Mooney Dr., Gaithersburg, Md. 20879. Tel. 301-258-8400. ATR-6800 with 9" video \$2,495.

MICROLOG

INNOVATORS IN DIGITAL COMMUNICATIONS

Community Mailbox (For RTTY and CW)

Our new expanded mailbox program stores all messages in a NON-VOLATILE battery-backed memory. Which means that you don't lose-it-all if the power is shut off! A total memory of 24576

- Open MAILBOX for messages
- Close MAILBOX
- Recall specific messages
- Delete specific message
- Send message directory
- De-activate MAILBOX system
- Send operating instructions
- Request 1 of 10 billboard messages
- Change operating speed
- Beacon mode
- User assigned key words

characters is available for messages. Here are some of the remote commands for the ATR-6800 mailbox.

Contest Dupe Sheet & Personal Station Log

Also utilizes the 24k character battery-backed memory for permanent storage. Variable format allows for short "CONTEST" type entries with auto-assigned consecutive number & time with worked/not worked and automatic "CALL & LOG"

features. Or, use a longer format for some personal info on each new QSO. You'll have instant recall of his name, QTH, & rig as well as the date & time of the last QSO.

Message Editor

Now you can generate professional quality messages with our Message Editor program.

- Full cursor control
- Screen scroll
- Readout of remaining buffer area

Insert blocks of text and make spot corrections. Here's a list of some of its features:

- HELP file display
- Local print
- Tape dump

24K Internal Memory

24576 BYTES or characters of storage for you to run your BASIC programs, keep the station log or implement the MAILBOX. The internal battery will maintain ALL this memory as well as the normal ATR-6800 "HERE-IS" & parameter storage for up

to a week. And, there's no need to keep the ATR on for one night to charge the battery. We've provided a jack for you to plug in an external low current 6 to 15 volt DC source for charging. (We have a small wall transformer power supply available.)

- / Division
- + Addition
- Subtraction

Relational Operators

- = Equal
- <> NOT equal
- < Less than
- > Greater than
- <= Less than or Equal
- >= Greater than or Equal

NOTE: With the addition of this total package all of the programs contained in applications module one are internal to the ATR-6800 except SSTV. In other words, you do not need an external module in the communications mode. "Basic" and Message Editor programs are, however, provided in a new applications module. (A separate SSTV module is available for \$49.95 if ordered with this package.)

2 METER 90 WATT OUTPUT AMPLIFIER WITH 18 DB GAIN PREAMP

Model 90PL
FOR ONLY
FACTORY DIRECT

\$139.95*
PLUS SHIPPING

- FREQUENCY range 144 - 148 MHz
- OPERATION FM or SSB (completely linear) Class AB1
- RF DRIVE 1 to 30 watts
- KEYING RF activated with high quality relays
- SSB operation built in delay
- POWER REQUIREMENTS typical 10 watts drive, 13 amps at 13.8 VDC
- IDLE current 20 mils
- MOBILE or FIXED operation
- PREAMP 18DB gain minimum
- NOISE FIGURE less than 1.5 DB
- PREAMP KEYING independent — separately RF activated relays
- CONSTRUCTION wrap around aluminum heat sink 2 pieces
- 360 degrees cooling
- SIZE 7"(w) x 6"(d) x 3"(h) — WEIGHT 3 lbs. 9 ozs.

The Sweet Sounding Repeater

MARK 3CR

A Stradivarius is more than a body, neck, and strings. The name alone says it is an instrument of out-
standing quality and beautiful sound.

In repeaters the name for optimum performance and clean, natural sound is Mark 3CR. And Mark 3CR
also means:

- Receiver sensitivity < 0.25 uV.
- Schmitt trigger squelch to capture fading signals
- 13 Morse messages
- Spurious rejection > 65 dB.
- Autopatch and reverse autopatch
- 15 Function controlled outputs
- Die cast aluminum receiver and transmitter enclosures

SATELLITES

PHASE IIIB PROGRESSES

The long-awaited launch of the Phase IIIB amateur satellite is now set for July 6, 1982. It has been nearly two years since the original Phase III satellite was destroyed when its Ariane launch vehicle exploded shortly after liftoff from the European Space Agency (ESA) launch facility in French Guiana. Supporters of the amateur space program are hoping fervently for a more successful outcome this time.

The first four launches of Ariane were test flights, and the AMSAT Phase IIIA bird had the misfortune of riding aboard the ill-fated second test launch. Since then, Ariance has flown successfully twice, and is now considered to be an operational launch vehicle. The Phase IIIB satellite will be a passenger on Ariane's second operational flight.

The Phase IIIB satellite is quite similar to Phase IIIA, but there are some differences. The on-board rocket motor, which is used to boost the satellite from its initial low orbit into a high elliptical orbit, is now a liquid-fuel device, as opposed to the solid-fuel design on IIIA. An additional communications transponder is included as well, a so-called "Mode X" transponder, with an uplink in the 23-cm band and a downlink at 70 cm. Phase IIIB will also carry a Mode B transponder, with its 70-cm uplink and 2-meter downlink.

The high orbit of Phase IIIB has several benefits. For much of the world, the satellite will be above the horizon, and available for communication, for hours at a time, rather than for 20-25 minutes as in the case of previous amateur birds. Tracking will also be simplified, since the satellite will appear to move quite slowly across the sky. The major disadvantage of the high orbit is that reliable communications through Phase IIIB will require a higher effective radiated power (erp) than the low-orbit satellites required. Estimates range from 500-1,000 Watts for Mode B to 1,000-2,000 Watts erp for Mode X. These levels can be achieved with reasonable amounts of power and high gain antennas.

AMSAT Satellite Report (ASR), a biweekly publication, is now running a "Phase III Countdown" article series to keep those interested in amateur satellites apprised of the events leading up to the Phase IIIB launch. Subscriptions to ASR are \$18 a year. Write to *Satellite Report*, 221 Long Swamp Road, Wolcott CT 06716.

THE RADIO SPUTNIKS

The communications transponder aboard RS-5 has been active, at least part of the time, since early February. RS-5 shares its communications passband with RS-6, and it appears that the RS-5 transponder is turned on only when there is no possibility of interference with RS-6.

Satellite watchers should pay special attention to RS-3 and RS-4 on May 1. This is May Day, a time the Soviets often select for unusu-

al events of all sorts. It is thought that this might be the occasion for a burst of activity from these previously quiet satellites.

GRM ON 10

The launching of the six RS satellites, and the resulting increase in Mode A activity, has focused attention on the problem of interference in the upper reaches of the 10-meter band. The downlink passbands of the RS transponders, beacons, and robots, as well as the Mode A downlink of OSCAR 8, all lie in the region between 29.3 and 29.5 MHz. This area is also populated with other amateur signals, and everything from FM to CW can be heard on the high end of 10 when the band is open.

For satellite users, the problem lies in the fact that satellite communications often occur at very low signal levels. The presence of a strong terrestrial signal in the wrong place can wreak havoc with satellite work. It is quite likely that the non-satellite users of this spectrum do not even realize that there is a problem. Fortunately, 10 meters is a large band; a few polite words of explanation can often result in a station moving out of the area of the band used by the satellites.

It should be remembered that no group of users has exclusive rights to any part of the amateur bands. On the high end of 10, a little mutual cooperation will go a long way.

RADIO MOSCOW

For an unusual source of RS information, try tuning your shortwave receiver to Radio Moscow's DX program. This five-minute show airs several times a week, but was recently heard on Sunday from 1925-1930 UTC. A typical program includes listener reports of interesting shortwave broadcasts heard, technical information on antennas and receivers, and sometimes a special feature, such as news of the RS satellites.

Radio Moscow broadcasts to North America on many frequencies, as any 40-meter op will attest. The 31-meter transmissions on 9710 and 9685 kHz seem particularly strong during the afternoon.

Thanks to AMSAT *Satellite Report* for portions of the above. — WB8BTH.

SOCIAL EVENTS

NEENAH WI MAY 1

The 3F Amateur Radio Club Swapfest will be held on Saturday, May 1, 1982, from 8:00 am to 3:00 pm, at the Labor Temple, Neenah WI. Admission is \$1.50 in advance and \$2.00 at the door.

Tables are \$1.50 in advance and \$2.00 at the door. There will be prizes, food and beverages, an auction, and a semi-formal banquet on Saturday evening. The banquet cost is \$8.00 per person to advance ticket holders and no banquet tickets will be available

OWEGO NY MAY 1

The Southern Tier Amateur Radio Clubs will hold their 23rd annual hamfest on Saturday, May 1, 1982, from 9:00 am until 5:00 pm at the Owego Treadway, Owego NY. Take NY Rte. 17 to

exit 65. Outside flea market spaces will be available. Features will include dealer displays, technical and non-technical talks, door prizes, and refreshments. Talk-in on 146.22/82 and 146.16/76. For additional information, contact Craig England KF2X, RD 1, Box 144, Vestal NY 13850.

MEADVILLE PA MAY 1

The eighth annual Northwest Pennsylvania Hamfest will

LARSEN GETS LEFT OUT IN THE COLD.

The Canadian Arctic presents some of the world's most difficult communications conditions. And when you're keeping track of expensive equipment recording crucial information, you can't afford to lose it in a snow drift. The need for a reliable antenna is a cold hard fact. It's a long way back to the shop for a replacement whip or coil.

That's why Larsen LM series Kùlrod antennas are used to keep track of scientific monitoring equipment on the polar ice. Because when communication hangs by a slender metal rod, you have to be sure it won't fail you.

That applies whether you're communicating in the Arctic or in a downtown traffic jam. It takes a reliable top performance antenna to do the job right.

And Larsen Antennas do, time after time.

Larsen's exclusive Kùlrod plating assures that maximum power goes into communication—not heat. So you can talk further. It's a finish that won't buckle under, even to icy exposure.

And the precision tapered stainless steel whip provides flexibility and minimizes radiation pattern distortion to give you a clear consistent signal all the way.

That consistent performance goes for our product integrity too. With a no non-sense warranty that won't leave you in the cold.

So whether you're tracking the back country or talking across town, you'll hear Larsen's performance loud and clear. Ask your favorite Amateur dealer to demonstrate how you can hear the difference with Larsen Antennas.

be held on May 1, 1982, beginning at 8:00 am at Crawford County Fairgrounds, Meadville PA. Admission is \$3.00 and children under 12 will be admitted free. Inside display area is \$5.00 (bring your own tables) and outside car space is \$2.00. There will be refreshments, and commercial displays are welcome. Talk-in on .04/.64, .81/.21, and .63/.03. For more details, write CARS, Attn: Hamfest Committee, PO Box 653, Meadville PA 16335.

LYNNFIELD MA MAY 1

The Quannapowitt Radio Association (QRA) will hold an indoor/outdoor hamfest on Saturday, May 1, 1982, from 9:00 am to 4:00 pm at South Hall Fire Station, corner of Salem and Summer Streets, Lynnfield MA. Admission is \$1.00 at the door. Reserved tables are \$5.00; at the hamfest, \$7.00. Food will be available. Talk-in on 146.19/.79 or .52. For additional details, write Dave Meldrum KA1M1, 28 Cedar Lane, North Andover MA 01845.

GREENVILLE SC MAY 1-2

The Blue Ridge Amateur Radio Society will hold the Greenville Hamfest on May 1-2, 1982, at the American Legion Fairgrounds, White Horse Road, 1/2 mile north of I-85, Greenville SC. Admission will be \$3.00 at the gate (no advance sales). Talk-in on 146.01/.61 and 223.46/224.06. For further information, write Gary D. Whidy, Hamfest Chairman, Rte. 6, Box 268, Travelers Rest SC 29690.

GRAY TN MAY 1-2

The Bristol Amateur Radio Club, the Johnson City Amateur Radio Association, and the Kingsport Amateur Radio Club will hold their second annual Tri-Cities Hamfest on May 1-2, 1982, from 9:00 am to 5:00 pm on Saturday and from 8:00 am to 4:00 pm on Sunday at the Appalachian Fairgrounds, north of Johnson City (off Highway 137), Gray TN. The dealer space charge is \$25.00 in advance and \$30.00 at the door for the weekend for a 10'x12' space. The dealer charge also includes security and admission for five employees. There are approximately 40 RV spaces with com-

plete hookups renting for \$5.00 per night inside the fairgrounds. Motels are available nearby. Dealers can set up anytime after Friday noon or after 6:00 am Saturday and Sunday. Further information can be obtained by writing Mary S. Biggs, Secretary-Treasurer, Tri-Cities Hamfest, PO Box 3682 CRS, Johnson City TN 37601, or phoning (615)-928-1818 after 5:30 pm and on weekends.

YAKIMA WA MAY 1-2

The Yakima Amateur Radio Club, W7AQ, will hold its annual hamfest on May 1-2, 1982, at the Ahtanum Youth Activities Park, Yakima WA. There will be overnight camping Friday and Saturday night at the site, ham equipment dealers, a raffle, and a free swap and shop. Doors open at 9:00 am on Saturday with lunch available on both days. Breakfast begins at 6:00 am on Sunday. No admission will be charged. Talk-in on 147.84/.24 and 146.52. For more information, contact David Pankey N7BRB, 512 South 7th Street, Yakima WA 98901.

STIRLING NJ MAY 2

The Tri-County Radio Association will hold its annual hamfest/flea market on Sunday, May 2, 1982, from 9:00 am to 4:00 pm, at the Passaic Township Youth Center, Valley Road, Stirling NJ. Donations are \$2.50 each and tables are \$6.00. Hot food and refreshments will be available and door prizes will include an Icom IC-2AT. Talk-in on 147.855/.255 or 146.52. For additional information, write Jack Sammarco, 2062 Emerson Avenue, Union NJ 07083, or call Herb Klawunn W2CHA at (201)-647-3461.

CENTRALIA IL MAY 2

The Centralia Wireless Association, Inc., will hold its annual hamfest on Sunday, May 2, 1982, at the Kaskaskia College gymnasium, 3 miles northwest of Centralia IL. Admission is free and there will be no charge for flea market and exhibit space. Doors will open at 7:00 am for setups and a limited number of tables will be provided on a first come, first serve basis. Food, refreshments, and plenty of free parking will be available. Various prizes will be

given away throughout the day; the main prizes will be awarded at 2:00 pm. Prize tickets are \$1.00 each or 6 for \$5.00. They may be purchased in advance by sending an SASE to Centralia Wireless Association, Inc., Hamfest Tickets, PO Box 1166, Centralia IL 62801. Talk-in on 147.27/.87 and 146.52. For further information, contact Bud King WB9QEG at (618)-532-6606, Lou Hodges W9IL at (618)-533-4724, or write to CWA, Inc., at the above address.

DORCHESTER MA MAY 2

The New England Amateur TV (NEAT) Group, Inc., will sponsor a general amateur radio outdoor flea market on May 2, 1982, rain or shine, at Freeport Hall, Dorchester MA, just off the SE Expressway. Admission is \$1.00. There will be 300 selling spaces in a secured area and sellers' admission is \$7.00 at the gate. Plenty of parking will be available. Talk-in on 145.29 and .52.

ROSEVILLE CA MAY 2

The North Hills Radio Club of Sacramento will hold its 10th annual ham swap on Sunday, May 2, 1982, from 9:00 am to 3:00 pm, at the Placer County Fairgrounds, Highway 65, north of Roseville CA. Admission and door prize tickets are free. There will be dealer displays, a large flea market area, and a grand prize of a Kenwood TR-7850 2-meter synthesized 40-Watt transceiver. Features will include club auctions, food and refreshments, and raffles. Talk-in on 144.59/145.19 and 223.18/224.78 (K6IS).

EAST HARTFORD CT MAY 2

The Pioneer Valley Radio Association will hold the fifth annual PVRA Flea Market on Sunday, May 2, 1982, at the George Penny High School, East Hartford CT (exit 91 off I-86) from 10:00 am to 4:00 pm. The admission donation is \$1.00 and tables are \$8.50. For an advance table reservation or further information, contact Arnie DePascale K1NFE, PO Drawer M, Plainville CT 06062.

FEEDING HILLS MA MAY 7

MORFAIN
HALF-SIZE FULL PERFORMANCE
Multi-Band HF Communications Antennas

MORFAIN is designed for maximum performance in the 160-10 meter bands. It features a unique design that allows for easy adjustment of element lengths and spacing to match local conditions. The antenna is built with high quality materials and is available in a variety of configurations to suit your needs.

TELEX
TELETYPE TERMINALS

TELEX terminals are essential for long-distance communication. Our catalog offers a wide selection of terminals from various manufacturers, including Telex Corporation and others. Each terminal is designed for reliability and ease of use.

MORFAIN
HALF-SIZE FULL PERFORMANCE

J. W. Miller
BELL INDUSTRIES

J. W. Miller is a leading manufacturer of electronic components and antennas. Our products are known for their quality and performance, and we offer a wide range of options to meet your specific requirements.

LARSEN ANTENNAS

LARSEN ANTENNAS offer a variety of antenna designs for different frequency bands. Our antennas are built with precision and are designed to provide excellent performance in a wide range of environments.

LARSEN QUICK MOUNT

LARSEN QUICK MOUNT antennas are designed for easy installation and quick deployment. They are ideal for use in field operations and other situations where rapid setup is required.

FOCKE

FOCKE offers a wide range of electronic equipment and components. Our products are designed for reliability and performance, and we offer excellent customer service and support.

3-TBA Tri-Band Beam
10 - 15 - 20 METER
Fixed Station Antenna

The **3-TBA Tri-Band Beam** antenna is a fixed station antenna designed for use in the 10, 15, and 20 meter bands. It features a unique design that allows for easy adjustment of element lengths and spacing to match local conditions.

HUSLER

HUSLER offers a wide range of electronic equipment and components. Our products are designed for reliability and performance, and we offer excellent customer service and support.

NYE VIKING

NYE VIKING offers a wide range of electronic equipment and components. Our products are designed for reliability and performance, and we offer excellent customer service and support.

THE GIANT **AZDEN**® COMPANY
 REVOLUTIONIZES THE STATE OF THE ART
 AWE AND AZDEN. INTRODUCE THE BRILLIANT NEW **PCS-2800**
 MICROCOMPUTER CONTROLLED
 SUPERIOR COMMERCIAL GRADE
10 METER
 FM TRANSCEIVER

\$299⁰⁰

COMPARE THESE FEATURES
 WITH ANY UNIT AT ANY PRICE

- **FREQUENCY RANGE:** Receive and transmit: 28.000 to 29.995 MHz, 10KHz steps with built-in - 100 KHz repeater offset.
- **ALL SOLID STATE-CMOS PL DIGITAL SYNTHESIZED.**
- **SIZE: UNBELIEVABLE! ONLY 8 3/4" x 2 3/8" x 9 3/4". COMPARE!**
- **MICROCOMPUTER CONTROLLED:** All scanning and frequency-control functions are performed by microcomputer.
- **DETACHABLE HEAD:** The control head may be separated from the radio for use in limited spaces and for security purposes.
- **SIX-CHANNEL MEMORY:** Each memory is re-programmable. Memory is retained even when the unit is turned off.
- **MEMORY SCAN:** The six channels may be scanned in either the "busy" or "vacant" modes for quick, easy location of an occupied or unoccupied frequency. **AUTO RESUME. COMPARE!**
- **FULL-BAND SCAN:** All channels may be scanned in either "busy" or "vacant" mode. This is especially useful for locating repeater frequencies in an unfamiliar area. **AUTO RESUME. COMPARE!**
- **INSTANT MEMORY-1 RECALL:** By pressing a button on the microphone or front panel, memory channel 1 may be recalled for immediate use.
- **MIC-CONTROLLED VOLUME AND SQUELCH:** Volume and squelch can be adjusted from the microphone for convenience in mobile operation.
- **DIRECT FREQUENCY READOUT:** LED display shows operating frequency, NOT channel number. **COMPARE!**
- **TEN (10) WATTS OUTPUT:** Also 1 watt low power for shorter distance communications. LED readout displays power selection when transmitting.
- **DIGITAL S/RF METER:** LEDs indicate signal strength and power output. No more mechanical meter movements to fall apart!
- **LARGE 1/2-INCH LED DISPLAY:** Easy-to-read frequency display minimizes "eyes-off-the-road" time.
- **PUSHBUTTON FREQUENCY CONTROL FROM MIC OR FRONT PANEL:** Any frequency may be selected by pressing a microphone or front-panel switch.
- **SUPERIOR RECEIVER SENSITIVITY:** 0.28 uV for 20-dB quieting. The squelch sensitivity is superb, requiring less than 0.1 uV to open. The receiver audio circuits are designed and built to exacting specifications, resulting in unsurpassed received-signal intelligibility.
- **TRUE FM, NOT PHASE MODULATION:** Transmitted audio quality is optimized by the same high standard of design and construction as is found in the receiver. The microphone amplifier and compression circuits offer intelligibility second to none.
- **OTHER FEATURES:** Dynamic Microphone, built in speaker, mobile mounting bracket, external remote speaker jack (head and radio) and much, much more. All cords, plugs, fuses, microphone hanger, etc. Included. Weight 8 lbs.
- **ACCESSORIES:** 15' REMOTE CABLE....\$29.95. FMPS-4R A/C POWER SUPPLY....\$39.95. TOUCHTONE MIC. KIT....\$39.95. EXTERNAL SPEAKER....\$18.00.

Zepp and Sons

— an end-fed, 1/2-wave antenna

Stan Gibilisco W1GV/4
 PO Box 561652
 Miami FL 33156

You probably have some idea of what a Zepp antenna is. It's end-fed with open-wire line and has to be tuned using a transmatch, right? Well, Zepp is a nickname applicable to many kinds of

Fig. 1. At (a), a full-wave current-fed antenna. The apex angle is 180 degrees. If this antenna is folded over on itself (b), we have the classical Zepp antenna. To be a true Zepp, it should be fed directly at the input point.

Fig. 2. The version of the Zepp most commonly used among hams. It operates at the fundamental and all harmonics.

antennas. Generally, any end-fed, half-wave antenna is a variation of the Zepp.

How did they ever come up with a name like Zepp? How does the Zepp antenna work? Can you use a Zepp, or variation, to advantage at your station?

The True Zepp

The Zepp originated from the demand for an end-fed antenna that did not require a substantial ground to work against. At first thought, this might seem like an unrealistic idea. But it can be done.

Fig. 1 shows the evolution

Fig. 3. Harmonic operation of the half-wave Zepp. At (a), operation on the fundamental (1/2-wave); at (b), second-harmonic operation (full-wave); at (c), third-harmonic operation (3/2-wave).

of the Zepp, so named because it was first used as an antenna dangled from a zeppelin! A full-wave antenna has a low resistive impedance when fed at a current maximum (a). Current feed of a full-wave antenna mandates that one side be 1/4 wavelength and the other side be 3/4 wavelength. The apex angle at (a) is 180 degrees, but smaller angles will work. The antenna will work even if the apex angle is zero degrees (b). When the apex angle is zero degrees, we in fact have a half-wave piece of wire fed at the end by a quarter-wave section of parallel-wire line.

At the input point of the transmission line in Fig. 1(b), the impedance is a pure resistance of a very low value. The quarter-wave piece of line, formed from the folding over of the original full-wave antenna, acts like an impedance transformer, bringing a high impedance down to a low one.

How the Zepp Works

The radiating part of the Zepp is, of course, the half-wave part extending past the parallel-wire line. One end of the line is just left hanging. How can this work?

Fig. 4. The J-pole. The bottom end is shorted and the matching point adjusted for minimum swr at resonance. The height of the matching section in feet is $2.80/f$, where f is given in MHz. The overall height of the structure is $700/f$. This is a monoband antenna.

The voltage at the end of the half-wave radiator is applied across a theoretically infinite impedance, which causes rf current to flow along the wire. It's kind of like shaking the end of a loose clothesline to make waves up and down the rope; although we never actually pull on the rope, the waves nevertheless occur along its length.

In theory, the Zepp is a balanced antenna because the impedance is infinite both at the free end of the line and at the terminated end. In practice, however, there is no such thing as an infinite impedance. The impedance at the free end of the line is extremely high, that at the terminated end is very high. They're a little different, and this unbalances the currents in the feedline. Consequently, the line radiates to some extent. This radiation can be minimized by ensuring that the impedance at the feedpoint is a pure resistance and is as high as practicable. This requires that the radiating part of the Zepp be exactly a half wavelength long,¹ and also that the antenna be placed as much in the clear as possible, to maximize the im-

pedance at the ends of the radiating length of wire.²

Yet, even if we dangle this contraption from a zeppelin at 40,000 feet, it won't be perfectly balanced. The feedline will invariably radiate a little energy. A properly operating Zepp is not too bad about this—it's almost as good as a center-fed antenna.

The Usual Zepp

Most hams who use a Zepp have an installation something like that shown in Fig. 2. With this kind of system, a transmatch is necessary since we don't know what the impedance will be like at the station. This kind of Zepp will work at the fundamental frequency (the band where it's 1/2 wavelength) and all harmonic frequencies. At any harmonic, the Zepp has a current node at the feedpoint. Harmonic operation of the Zepp is shown in Fig. 3.

The Zepp is somewhat temperamental about departures from its resonant frequency. Even a tiny change in frequency will move the current node away from the feedpoint—either out onto the radiating part of the antenna (frequency

too high) or down into the transmission line (frequency too low). But the node at the loose end of the line cannot move. The result: line radiation! The Zepp is a narrow-band antenna.

What if you have no transmatch and do not exactly feel like running out to your local ham shop and plunking down a hundred dollars or so to buy one of those fancy things they're selling nowadays? Can you still use a Zepp? Definitely. Fig. 4 shows one way to get a good match to 52- or 75-Ohm coaxial cable. Fig. 5 illustrates a second method. When the correct matching point is found, the swr is 1 at resonance.

Vertical Sans Radials

Of course, we can orient a Zepp in any direction we want. Figs. 4 and 5 show two vertical Zepp antennas. The antenna in Fig. 4 is often called a J-pole and is fairly common at VHF. But it is practical down to about 20 meters, and if you're ambitious, you might want to try building one for 40. In Fig. 5 is a method of feeding a half-wave radiator. This is definitely practical down to 40 meters. Both of these

schemes constitute Zepp feed. Both of these antennas are monobanders, though, because of the matching technique used.

These antennas do not need any radial system. In both instances, the base impedance is very high and thus ground loss is kept to a minimum. Adding radials to the antenna in Fig. 5 will improve its performance, because of the gain resulting from the image signal. (This will provide the equivalent of a 2-element collinear.)

Other Zepps

A half-wave sloper may be fed at the end instead of in the center. The performance of the antenna will be the same in either case. This is shown in Fig. 6(a).

Zepp feed, because of its convenience, allows an exotic method of getting the antenna up in the air. This is shown in Fig. 6(b). The feedline should be TV-type twinlead, in order to minimize the weight, and the kite may have to be pretty big. But this idea has been used successfully on 160-meter endeavors when the wind is strong enough! One word of caution: Make sure the system is not flown

Fig. 5. Zepp feed for a half-wave vertical. The length of the open-wire matching section in feet is 275/f. (Don't use TV twinlead!) Adjustment of the matching point is required; a good starting point is 1/6 of the way from the shorted end to the antenna end of the matching section for this antenna and for the J-pole.

Fig. 6. At (a), end feed for a half-wave sloper. At (b), well, end feed for a half-wave sloper! These antennas will work at the fundamental and all harmonics.

ELECTRONIC HOBBY INNOVATIONS

7510 GRANBY STREET SUITE 207 NORFOLK, VIRGINIA 23505

above utility lines. Also, some guy back in the 1700s already proved that thunderstorms contain electrical energy. There is no need for you to prove it again.

Conclusion

The Zepp is versatile because end feed is physically convenient. This results in some line radiation, but if the antenna is located wisely and cut to the proper length, this problem is not serious.

The Zepp may be operated at any harmonic, although the bandwidth tends to be narrow. As a rule, consider the useful bandwidth of a Zepp to be 50 kHz either side of resonance, whether it is operated on the fundamental or a harmonic. Example: A Zepp that is a half wavelength at 7050 kHz may be used between about 7000 and 7100, 14050 and 14150, 21100 and 21200, and 28150 and 28250 kHz. (Outside these ranges, the anten-

na will work, but there will be significant radiation from the feedline.)

Now dig out those old porcelain insulators (you *did* save them, didn't you?) and that 300-foot roll of stranded no. 14 copper wire you bought last year at Dayton for \$1.50 and thought you could never use. Hang a Zepp someplace! ■

Notes

¹ For wire antennas, use the formula: length (feet) = 468/f, where f is given in MHz, for the length of a half wave. This is only approximate and may have to be pruned, but it represents the best average value.

² After the antenna has been cut according to the formula, you can find its resonant frequency by using a field-strength meter placed a few feet from the feedline near the transmitter. The resonant frequency is the frequency where the field strength is minimum, indicating minimum line radiation. Then, the antenna may be pruned until its resonant frequency is as desired.

Apple^{*}

TERMINALL

NORMAL DISPLAY

TERMINALL now available for APPLE II! TERMINALL T2 is a hardware and software system which converts your Apple II computer into a state of the art communications terminal. Simply insert the interface card into any available card slot (1-7) in your APPLE II, then plug the attached cables into your radio.

Simplicity

TERMINALL was designed from the outset to be easy to connect to your radio and easy to use. Plug into your receiver headphone jack and copy Morse Code or radioteletype (RTTY). Plug into your CW key jack and send Morse Code. Attach a microphone connector and send Baudot or ASCII RTTY using audio tones (AFSK). That's all there is to hooking it up.

The software is loaded into your computer from disk. Enter your callsign and the time and you will start receiving immediately. No settings or adjustments are necessary to receive Morse Code, it's fully automatic - and it works! You may type your message while receiving or transmitting.

You will be on the air, receiving and transmitting in any mode, in minutes. As we said, TERMINALL is simple.

More for your money.

TERMINALL has the RTTY terminal unit - demod and AFSK - built in. This results in a lower total cost.

Fantastic Morse reception. Six stage active filter demodulator copies the weak ones. Auto adaptive Morse algorithm copies the sloppy ones. Received code speed displayed on status line.

Outstanding documentation. Professionally written, 90 page user manual contains step-by-step instructions.

Built in, separate, multi-stage, active filter RTTY and CW demodulators. No phase lock loops. RTTY demodulator has 170 and either 425 or 850 Hz shift-keyboard selectable - and uses either the panel meter or scope outputs for easy tuning. Copy the weak ones. Copy the noisy ones. Copy the fading ones.

Built in crystal controlled AFSK. Rock stable for even the most demanding VHF or HF applications. A must on many VHF RTTY repeaters.

Built in 110 or 220 volt AC power supply

Built in parallel printer driver software. Simply attach a parallel ASCII printer (e.g. the EPSON MX-80) to your printer port to obtain hardcopy in all modes.

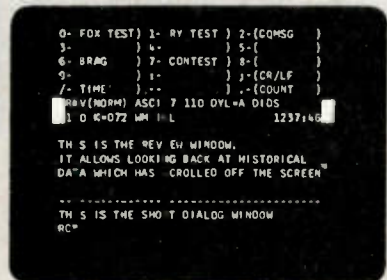

Multi level displays - allows examining and editing of historical text.

Word wrapping, word mode editing, diddle, ignore carriage returns, user pro-

grammable end of line sequence, adjustable carriage width, multiple user-defined WRU, transmit delay (fixed, none or auto adaptive), break mode and more!

The all-in-one TERMINALL design makes it great for use on HF or VHF, Ham, Commercial, SWL or MARS! SWL's: TERMINALL may be jumpered for either 425 or 850 Hz reception to copy news and weather services.

FT101 TS520 TS820 FILTER CASCADING

Probably the most popular units ever produced, these solidly built transceivers were built to LAST. If you can live without gadgetry, why replace your reliable time-tested rig with a costly new model? Especially since you can easily make your receiver equal in selectivity and ultimate rejection to any now on the market with an inexpensive

Fox-Tango Filter-Cascading Kit! CONSIDER THESE FEATURES

- Easy installation - 30 minute average.
- No drilling, switching, alignment.
- Results of 16 poles of filtering:
 - Filter Shape Factor as high as 1.19.
 - Ultimate Rejection better than 100dB.
 - Works wonders on SSB; improves CW.
- Compensates for Filter insertion loss.
- Complete instructions, clear diagrams.
- No RX audio impairment, TX unaffected.
- Fits all models of Series - any letter.
- 10% off if any four are ordered at once.

TS520 Series: Order Kit No. 520K \$70
 TS820 Series: Order Kit No. 820K \$70
 FT101 Series (not ZD): Order Kit No. 4K \$75
 FT101ZD Series: Order Kit No. 4K-ZD \$75

Prices include shipping to U.S. & Canada; Overseas Air \$5. Florida Sales Tax: 4%. All kits include a genuine 8-pole top-quality FT Filter, improved cascading/mini-amp circuit board, all needed parts, cables, and detailed instructions.

In addition to the above, Fox-Tango features cascading kits for the FT-901/2 (\$65), FR-101 (\$55), Heathkit SB104A (\$60). Also a wide line of SSB, CW, AM, and special filters for Yaesu, Kenwood, Drake R4C and 7-Line, Heathkit, and Collins 75S-3B/C.

NEW!

TS830S and R820 KITS

A Matched Pair of 2.1KHz Fox-Tango Filters replacing the existing 2.7KHz first and second 2.7KHz SSB IF filters produces receiver improvements which users have characterized as "...Spectacular SSB RX!" "...makes the VBT work as I dreamed it should..." "...results are almost unbelievable..." "...completely eliminates need for CW filter..." (Names on request.)

Fox-Tango filter characteristics are notably superior to stock items, especially those of the modest ceramic 2nd IF; our substitute is a high-quality 455KHz 8-pole discrete-crystal filter. Resulting bandwidth is about 1.9KHz, Shape Factor 1.2, Ultimate Rejection at least 110dB!

Regular prices: \$55 + \$125 = \$180 + shipping

Introductory Price: \$150 for Complete Kit Includes Matched Pair of FT 8-pole filters,

All needed cables and parts.

Complete instructions.

CW Filter not needed - Quantity discount applies!

All Fox-Tango crystal filters are guaranteed for **ONE YEAR**. Beware of cheap imitations; they are no bargain! Don't be fooled. **GO FOX-TANGO — TO BE SURE!**

BUGGED BY MORSE CODE?

TURN THE MORSE CODE HASSLE INTO THE FUN IT SHOULD BE WITH THE NEW KEYER-TRAINER MODEL KT-2 BY AEA.

NEW ... \$89.95

Does not include DC-2 External Battery Pack

The new model KT-2 KEYER-TRAINER uses an AEA microcomputer with copywritten software, featuring exclusive automatic speed increase that literally pulls you through psychological speed barriers. Users of the model KT-1 predecessor report Morse code success never before achieved by all other methods tried. The exclusive AEA training method is increasing one's Morse speed copying ability in the shortest time, for all who want to learn.

In addition to the powerful trainer features, the KT-2 is also a full feature keyer which will interface with all the popular iambic or single lever paddles on the market. Best of all, the new KT-1 price represents a **30 percent reduction** from the KT-1 predecessor.

Power Line Filters

Model LF6

Model LF2

These filters protect any sensitive electronic equipment from power line transient damage and radio frequency interference. Both models offer common mode and differential mode surge suppression for power line "spikes". Rf interference is suppressed using both inductive and capacitive components. Ideal for computers, test equipment or TV.

LF2 a duplex outlet, 120V, 8 amps max \$39.95

LF6 three separately filtered duplex outlets, 120 V, total fused capacity 15 amps, power switch and indicator lamp \$59.95

Add \$2.50 shipping and handling per order.

Send check with order and provide street address for UPS shipment. Ohio residents add Sales Tax. Charge card buyers may call toll free:

STAND ALONE VIDEO BOARD SCT-100

AMATEUR RADIO TELETYPE APPLICATIONS

For RTTY applications the SCT 100 permits the radio amateur to get on the air at minimum cost. Its 60 ma. BAUDOT interface connects directly to most FSK terminal units and when not in use, it may be switched to ASCII mode for use with a home computer. In BAUDOT mode the SCT 100 receives and transmits a 5 bit code compatible with model 15 or similar Teletypes (TM).

COMPUTER TERMINAL APPLICATIONS

The SCT 100 has been configured for direct use with any mini or micro computer system having a serial ASCII interface. This includes stand alone operation with only an external 12.6 VAC transformer, or direct insertion into any \$100 compatible card cage.

- SCT 100 VIDEO BOARD ASSEM / TEST 229.00
- SCT 100 VIDEO BOARD KIT 189.00
- SKT 100 KEYBOARD TERMINAL ASSEM / TEST 449.00
- SKT 100 KEYBOARD TERMINAL KIT 389.00

**ABM-200
UNIVERSAL CONVERTER
ASCII - BAUDOT - MORSE**

APPLICATIONS

- TTY speed converter
- Interfaces BAUDOT Teletype to ASCII computer
- Interfaces ASCII terminals to BAUDOT for RTTY
- Converts between TTY and Morse
- Morse Code Trainer

Digital Multimeter

The Drake DM2350 Digital Multimeter is a convenient, small handheld liquid crystal display meter ideal for the serviceman or hobbyist. This 3½ digit meter is auto-ranging, auto-zeroing, has polarity indication, and an over-range warning signal. Battery life is greater than 300 hours with a "low battery" indicator. A continuity test sounds a signal when circuit resistance is less than 20 ohms. Dc accuracy is a basic 0.8%.

Batteries, probes, 20 amp current shunt, spare fuse and soft carrying case all included at \$95.95

Add \$2.50 shipping and handling per order.

Send check with order and provide street address for UPS shipment. Ohio residents add Sales Tax. Charge card buyers may call toll free:

Surviving the Unthinkable

— part I: the ham's role

Today they hauled out the last of the Civil-Defense supply cans from our office building. It wasn't

much of a loss, however, because long ago the familiar drab green cans with their black lettering had

been emptied of their contents. Once they had stored food, water, medical supplies, radiation-monitoring equipment, clothes, etc., enough material for several hundred people to survive for two weeks after a worldwide nuclear holocaust.

plies gracing the basements of public buildings has all but disappeared. Only a few of the once-common fallout shelter signs remain. Most likely, if you care to check a building displaying a shelter sign, you will find plenty of shelter and no usable supplies.

But the food grew rancid and the other materials deteriorated. With several reorganizations of the building, the cans constantly were reshuffled into corners until, finally, there was no other place to put them but out with the trash. Tonight they most likely grace the garage of a member of the maintenance staff who saw them as too good to discard and recovered them to use for workshop trash, discarded cuttings from his table saw, or some such refuse.

So, what would happen if our nation's 225 million people suffered an attack by a nation using nuclear warheads? Are we totally unprotected? Out of luck? Frankly, according to civil-defense planners, people heading for those old-style shelters might be out of luck, anyway. The shelters are often located in downtown areas of large metropolitan areas. With a direct hit to one of these cities, it is very likely that the shelter would provide as much protection to its occupants as no shelter at all. Cities where this problem is expected to occur are shown

The case here is common. The once-familiar sight of fallout shelter sup-

The fallout shelter sign is a symbol of protection which is now giving way to crisis relocation plans.

"BRAND NEW"
**CHAMPION MESSAGE
 MEMORY KEYER**
 Model TE-292
\$125.95

Features:

- State-of-the-Art CMOS Circuitry
- Choice of Message Storage
 - A Six 50 character messages
 - B Twelve 25 character messages
 - C 27 combinations of message C programming
- Records at any speed—plays at any speed
- Memory operating LED
- Use for daily QSO or contests

PLUS:

- Self completing dots and dashes
- Both dot and dash memory
- Iambic Keying with any squeeze paddle
- 5.50 w p m
- Speed, volume, tone, tune and weight controls
- Sidetone and speaker
- Low current drain CMOS battery operation—portable
- Rear panel Jack for auxiliary power
- Deluxe quarter-inch jacks for keying and output
- Keys grid block and solid rigs
- **WIRED AND TESTED FULLY GUARANTEED—LESS BATTERY**

\$89.95

Features: Model TE-284

- State-of-the-Art CMOS Circuitry
- Three choices of Message Storage
 - A Two (50 character each) message storage
 - B Four (25 character each) message storage
 - C One 50 character and two 25 character message storage
- Records at any speed—plays at any speed
- Memory operating LED
- Use for daily QSO or contests

PLUS:

- Self-completing dots and dashes
- Both dot and dash memory
- Iambic Keying with any squeeze paddle
- 5.50 w p m
- Speed, volume, tone, tune and weight controls
- Sidetone and speaker
- Low current drain CMOS battery operation—portable
- Deluxe quarter inch jacks for keying and output
- Keys grid block and solid rigs
- **WIRED AND TESTED FULLY GUARANTEED—LESS BATTERY**

**MESSAGE
 MEMORY KEYER**

Model # TE201
\$75.95

Features:

- Advanced CMOS message memory
- Two (50 char each) message storage
- Repeat function
- Records at any speed—plays back at any speed
- Longer message capacity
 Example: send CO CO CO DX de WB2YJM WB2YJM K then play second message on contact de WB2YJM OS. NY NY 579 579 Paul K
- Use for daily QSOs or contests

PLUS:

- State of the art CMOS keyer
- Self completing dots and dashes
- Both dot and dash memory
- Iambic keying with any squeeze paddle
- 5.50 wpm
- Speed volume tone tune and weight controls
- Sidetone and speaker
- Low current drain CMOS battery operation—portable
- Deluxe quarter inch jacks for keying and output
- Keys grid block and solid state rigs
- **WIRED AND TESTED FULLY GUARANTEED—LESS BATTERY**

Model # TE144
\$65.95

**Features: Deluxe CMOS
 Electronic Keyer**

- State-of-the-art CMOS circuitry
- Self completing dots and dashes
- Both dot and dash memory
- IAMBIC keying with any squeeze paddle
- 5.50 wpm

- Speed, weight, tone, volume tune controls & sidetone and speaker
- Semi-automatic "bug" operation & straight keying—rear panel switch
- Low current drain CMOS battery operation—portable
- Deluxe quarter inch jacks for keying and output
- Keys grid block and solid state rigs
- **Wired and tested—fully guaranteed—less battery**

MODEL TE133—same as TE144 with wgt and tone control internal, less semi-auto keying \$55.95

MODEL TE122—same as TE133 less wgt, tune, solid state keying \$45.95

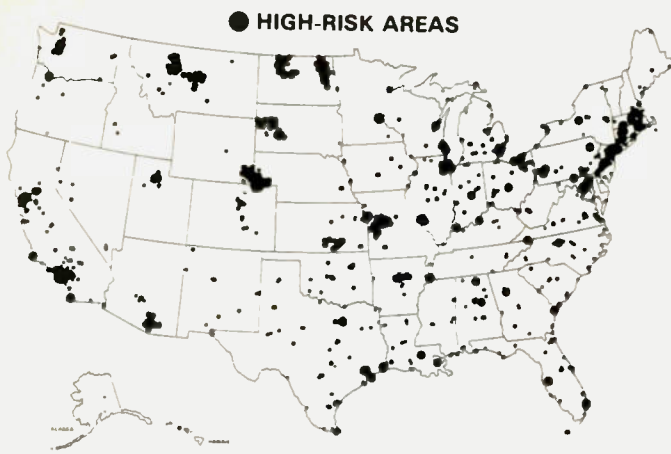

Fig. 1. The dots here represent possible high-risk areas which require crisis relocation plans.

in Fig. 1, which is a map of cities most likely to receive direct hits in an all-out nuclear war.

The idea of these home cities being targets of some foreign nuclear power is not a pleasant thought. But in a world of increasing tensions, there no doubt will be an increased interest in our praying for peace, and also preparing for our own personal defense in the event our world leaders some day fail to keep the peace.

As an alternative to hiding in big-city shelters, planners suggest that it may be better to move people out of the crucial areas where devastation is most likely to occur. (Fig. 2 shows the sphere of effect for each 1-megaton device.) This plan is apparently patterned after a Russian plan discovered several years ago.

According to a recent publication of the Federal Emergency Management Agency, which now handles civil defense, the new plan is as much a negotiation plan as anything. They feel that in a game of superpower brinksmanship, where each side will see just how far the other will go before "pushing the button," the Russians would most likely evacuate their cities as a defense mechanism before launching an attack on us. Naturally, the planners feel our intelligence sources

would let us know of the evacuation. At that point, we would rely on our country's availability of rapid transit and family cars to completely evacuate before the Russians do. We would then declare that since we're safe and they're not, they should back off and forget about blowing us to oblivion.

There are some good points about the plan. It is true that the United States has great versatility due to our widespread use of private cars, while the Russians cannot afford to have a car in every garage and would need to rely on trains, buses, and "marching routes" to move their people 30 to 200 miles from major cities. An illustration of their plan is shown in Fig. 3. The weather, however, complicates survival, as shown in Fig. 4.

Calculating the cold hard facts and the alternatives of attack plans, civil-defense authorities in the US figure that if the Russians attacked before evacuating, they would lose about 100 million civilians. On the other hand, if they evacuate first, they would lose a mere 20 million.

A non-classified Federal Emergency Management Agency report issued in October, 1980, states five key points about a Soviet attack strategy.

Fig. 2. Expected effects of 1-megaton air blast.

"1) The Soviets probably have sufficient blast-shelter space in hardened command posts for virtually all of the leadership elements at all levels (about 110,000 people).

2) With a few hours of warning or less, the Soviets would suffer over 100 million casualties, but a large percentage of the leadership elements probably would survive.

3) With 2 or 3 day of preparation, the Soviets would suffer less than 50 million casualties.

4) With a week (or more), they would suffer casualties in the low tens of millions.

5) Therefore, the critical decision to be made by the Soviet leaders in terms of sparing the population would be whether to evacuate cities. Only by evacuating the bulk of the urban population could they hope to achieve a marked reduction in the number of urban casualties."

The same reasoning applies to the United States. The most horrifying part of the statistics is that at the very least we're talking about tens of millions of lost lives. And that doesn't count radiation sickness, burns, exposure, starvation, etc.

The United States system was scheduled to be in place for most all cities during 1981. Under the system, planners believe that 80% of our population would survive to rebuild. Again,

they do not estimate the aftereffects of such a disaster on the survivors of any nation.

Even after the plans are completed, there will be much additional work to be done: Shelters need to be constructed; managers need to be trained; tests of the system must be made, followed by evaluation of the tests and redirection based on the results of the tests.

Amateur radio is not mentioned in the FEMA publication sent to me regarding the crisis relocation plan. The response I received from an FEMA official states, "Those amateur radio operators who operate with Radio Amateur Civil Emergency Services (RACES) are still a very important part of civil preparedness. RACES licenses as such are no longer being issued by the FCC, but each RACES operator uses his own call letters. However, these persons must be recognized as part of the civil-preparedness organization in order to operate during emergencies under the auspices of RACES. Any RACES planning should be done with your own state of Iowa and the FCC."

Such planning is of little consolation to the residents of a state when they find out that nearly all of the state's (Iowa) 4,000 hams cannot operate, and the few licensed to operate the state's RACES station left the state one day ahead of a nuclear attack.

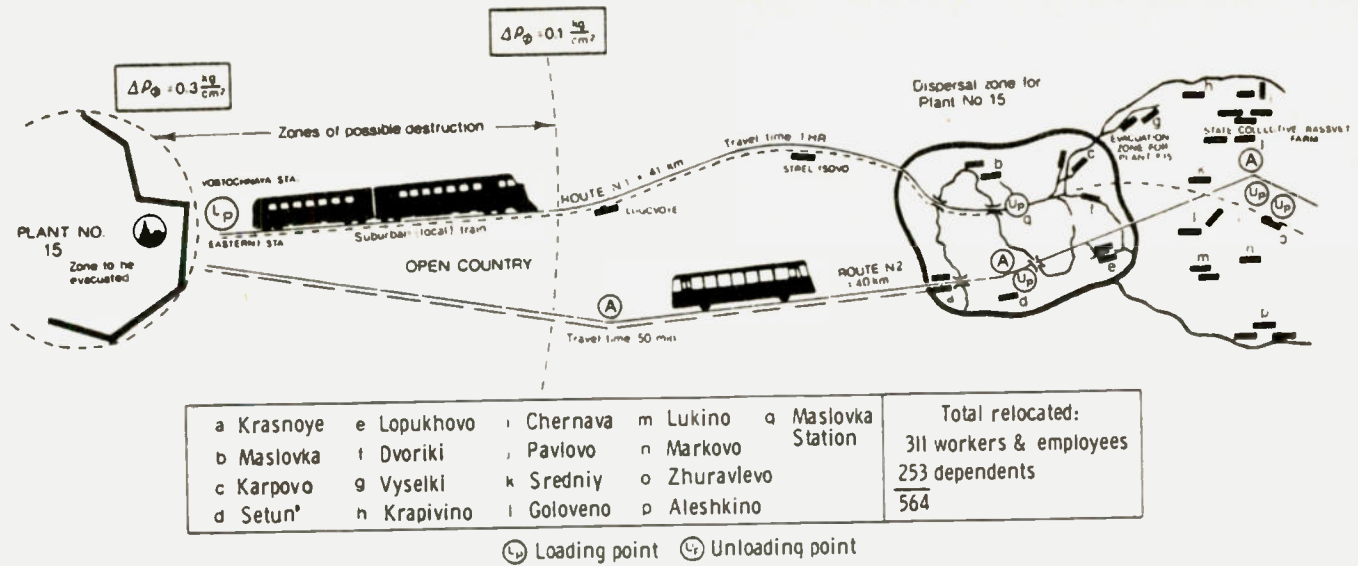

Fig. 3. According to the Federal Emergency Management Agency, this diagram shows Soviet plans for a crisis relocation program. The plan calls for dispersal of the population and daily commuting of workers to their places of employment.

By comparison, the May, 1980, issue of 73 Magazine carried an article which described amateur activities when about 300,000 people came to Des Moines, Iowa, for an afternoon visit with Pope John Paul II. More than 150 local and statewide amateur radio operators provided excellent health and welfare services that day. The ratio of ham operators to population was about one amateur station for every 2,000 people. A substantially greater ratio was provided in areas where the sick and invalids were.

The situation in Des

Moines was perhaps the best possible test of a crisis relocation program anywhere in the world since planners considered the notion of relocating hundreds of thousands of people. It was a complex program which was not easily undertaken. But on the specific point of supply of amateur radio operators, if the same ratio of amateur radio stations to population were applied to a national crisis-relocation program, one out of every three amateur radio stations in this country would need to be on the air in some assigned duty all the way from two meters through 160 meters. CW,

FM, and SSB, in hundreds of orderly, planned, and tested networks, would be needed.

It is extremely unlikely that the present RACES system could come close to meeting the needs. As of December, 1979, there were only 610 officially licensed RACES stations on the FCC's books. We would need no less than 112,000 dedicated patriotic and very brave volunteers and their equipment.

The time is definitely here for amateurs to approach their local civil-defense authorities and the FCC to have this now-sophisticated service available on a widespread basis to every interested amateur radio operator in the event of a national emergency. Amateur radio is the only service which can provide a most-reliable communications system under severe circumstances when, for example, the entire telephone system would be rendered totally useless, merely because major switching locations would no longer exist!

Ham radio operators should be encouraged to improve their Morse-code capabilities, because under such strenuous situations,

when even an amateur system may reach its peak in traffic-handling capabilities, every cycle of bandwidth of spectrum space is vital to the proper completion of the task. Currently, only CW operation can offer a bandwidth of just a few hundred cycles.

Right now, none of us, in our wildest dreams, can imagine how horrifying the world would be after a nuclear war. Our surviving population would need all the possible assistance that could be mustered, including medical supplies, food, and shelter, to name only a few. The existence of the top-notch amateur system like the one we now have could be the single most important item and could provide the key to our success.

In part II of this article, I will provide some details on just what can be done at each of our ham stations to lessen the danger to our communications systems. Some methods are simple, others incredibly expensive, but all of us can do something. ■

Acknowledgement

Figs. 1 through 3 are from US Crisis Relocation Planning, Federal Emergency Management Agency, 1980.

Fig. 4. This is one of many possible distributions of fallout from a nuclear attack on the United States. The actual distribution would, of course, depend on the location and number of actual strikes and weather conditions.

AWARD DIRECTORY

Countless letters and phone calls have been received regarding a proposed award directory, supposedly being sponsored by this magazine. To set the record straight and to avoid any further confusion, allow me to say that such a 73 publication just does not exist. That, of course, does not mean one will not be available in the distant future!

To attempt such an endeavor, the compiling of precise and up-to-date information becomes paramount and obviously the most difficult task. Unfortunately, too often, the author of such a publication has to be at the mercy of the various amateur radio clubs and organizations to provide him with the necessary input to make such a volume a reality. However, due to the apparent lack of interest of so many to submit information about their respective awards programs, we have almost discounted the idea altogether. Those who are theory-oriented will understand that no input is directly proportional to negative output!

However, to preserve the well-known Wayne Green tradition, "never say die," another attempt will be made to remuster the readership for their help to fill this void in our award files. We could use data on any award program you or your local club may be sponsoring, as well as any information regarding other award programs you may be aware of.

When you forward the various rules for each award, be sure to include an original of each award certificate so that it may be published in its entirety. After all, this is free advertising, ladies and gents! Don't you realize the exposure you'll be getting? The fact is, you will not have to pay \$1500 per page as all advertisers have to just to get their message across to the readers. Take advantage of this unbelievable offer which only Wayne Green himself could ex-

tend to the readers of the most popular magazine in the hobby!

Send your award program rules and original award certificates directly to: Awards Directory, Attn: Bill Gosney KE7C, 2665 Busby Road, Oak Harbor WA 98277. Do not delay—send me your input today. Then, over the months ahead, perhaps we can put together the directory you've all been waiting for.

INTERNATIONAL AMATEUR RADIO SOCIETY

The International Amateur Radio Society (IARS) is an achievement, educational, public service, and amateur radio honor fraternity. It is the parent organization for the International Certificate Hunters Club (CHC), the International Shortwave Listeners Certificate Hunters Club (SWL-CHC), the International Amateur Radio Journalistic Society (IARJS), and the International Flying Hams Club (FHC), along with many affiliated subdivisions worldwide called either chapters or amateur radio associations.

The IARS publishes the *International Amateur Radio Society Annual*, which incorporates *The Directory of Certificates and Awards*, copyrighted internationally. The IARS also publishes the newsletter *Dialog*, through the IARJS, and the newsletter *Xtra*, the official house organ which reports news, special events, DX forecasts, and other items of interest to all members.

Through the CHC, the IARS sponsors many operating events, community services, achievement awards, and on-the-air nets. The IARS and its affiliates do not engage in partisan politics, but do take interest and action with regard to matters concerning the world's radio amateurs. It seeks to assist and cooperate with the many national amateur radio organizations (such as the ARRL, RSGB, JARL, etc.) in nations the world over. Although we may not always agree with what or how they do things, we acknowledge their efforts and lend them our support and participation.

The purposes of this organization are:

- to create and maintain an international communications system composed primarily of on-the-air amateur radio networks for all amateurs;
- to institute educational training programs and activities designed to advance the radio amateur's operating proficiency and technical knowledge, with emphasis on on-the-air gentlemanly conduct and compliance with the intent and interest of applicable national regulatory laws;
- to institute worldwide educational programs promoting improved human relations, international goodwill, and fellowship among men and women everywhere, without restriction or discrimination as to race, creed, color, national origin, political views, or religious belief;
- to promote the concept that shortwave listeners (SWLs) are fraternal kin to licensed amateurs and should be included in their programs and affairs;
- to promote the general welfare and survival of amateur radio as established under the International Communications Treaty;
- to publish educational books, magazines, newsletters, and literature in fields relating to international amateur radio; and
- to provide a comprehensive awards program, through the CHC, and to encourage and document the communication skills displayed by licensed radio amateurs and shortwave listeners.

The IARS, IARJS, CHC, SWL-CHC, and the FHC were created by Clif Evans K6BX in 1960 and have been protected as part of the copyrighted works of the *Directory of Certificates and Awards*. At the time of OM Clif Evans' death, the IARS, IARJS, CHC, SWL-CHC, and the FHC, along with 100 chartered, affiliated subdivisions called either chapters or associations, had over 22,000 members on the rolls, representing over 250 countries from all six continents.

They are making every effort possible to contact all of the members they have lost touch with since the death of Clif Evans and the closing of the old headquarters. Individual notifi-

cation has been sent to each member via the bureau, and new club literature has been sent (via air mail) to all previous officials and office holders along with many national organizations and radio clubs around the world.

They look forward to all of their members around the world returning to active status.

The *International Amateur Radio Society Annual* is a yearly publication containing operating information and technical data, schedules of coming events of interest to the amateur community, net listings, DX tips, and much more. Included in the *IARS Annual* is *The Directory of Certificates and Awards*, the most comprehensive digest and guide to award-hunting ever offered to the amateur. The *IARS Annual* is also the organization's yearbook, offering a retrospective view on the past year and a look into the coming year, complete with IARS information on rules, codes, membership listings, and other items of interest to both the membership and amateurs at large.

The *IARS Annual* is published, revised, and updated annually in November, and covers in depth those topics not found in other handbooks. No amateur radio library is complete without it!

IARS Divisions Defined

IARJS: an international organization that provides a free and uncensored outlet for ideas, opinions, and proposals on behalf of amateur radio, through articles submitted by its members. These articles appear in the IARJS newsletter, *Dialog*, which provides its contributors an opportunity to inform radio amateurs throughout the world of conditions and situations affecting amateur radio. *Dialog* is a forum in which journalists and editors from around the world can exchange thoughts, ideas, and opinions on all matters concerning the future of amateur radio.

CHC: an international organization created to maintain an international communications system composed primarily of on-the-air amateur radio networks for all amateurs. The CHC also provides a comprehensive awards program and a vehicle for the procurement of awards from the many organizations around the world. Through its

system of networks, it provides the availability of contacts necessary for the achievement of these awards.

SWL-CHC: a mirror image of the CHC. SWL-CHCers seek the same achievement as radio amateurs except on a heard basis. All radio amateurs are also SWLs in half of all they do on the bands and are invited to participate in this division. The SWL-CHC also can provide the call-sign necessary for QSLing through the bureau.

FHC: self-explanatory. Membership is available to any licensed radio amateur or SWL who holds, or has ever held, any nature of pilot's license or designation: aircraft, lighter-than-air vehicle, space, or glider.

Net Activity

CHC nets are 10, 15, 20, 40, and 75 meters as the demand dictates. Some of our nets are: CHC DX net, 0200 to 0500 UTC, 14.298 ± QRM, daily; CHC DX net, 1900 to 2200 UTC, 21.370 ± QRM, daily; and CHC Pacific family hour, 0000 to 0300 UTC, 21.370, daily.

Old CHC/New CHC

If you were familiar with the previous organization under Cliff Evans K6BX, you will notice that they have instituted some drastic changes in both the way the club is handled and its value system. The new organization bears little resemblance in many areas to its predecessor, and they are sure you will find the changes to your liking. It is a blend of old and new and should be worthy of your review.

Membership is not a requirement for participation in either the awards program or any net activity. Membership is available with each division independently. Inquiries regarding membership are solicited. A bona fide interest in amateur radio is the only essential qualification (unless otherwise specified). When membership is attained, a membership number is issued which one holds forever regardless of change in name, call, QTH, class or license, or status of membership. Membership numbers and certificates are issued independently by each division. Membership in one division does not constitute membership in another.

Dues are payable during the first month of each year, January 1-31, following initial joining.

Failure to pay dues will result in the member status being changed to inactive. Inactive members do not receive the newsletters, special club services, or voting rights when applicable. Inactive members always retain their original number. A member can go inactive in one division and still stay current in another. Payment of only present year's dues (not past) will restore any member to active status.

Newsletters are included with each membership, but are only available to members on active status. Articles are solicited from the members. They welcome information on all subjects pertaining to amateur radio, including hints and kinks, your local club's activity, awards issued by other organizations, etc.

Certificates of membership are issued to each new member with the approval of their application. They are of the highest quality and are very worthy of display.

Fees/dues for the IARS, CHC, SWI-CHC, and FHC are as follows: joining each division—\$6.00 (overseas—\$7.00, no pro-rating); yearly dues, each division—\$4.00 (overseas—\$5.00), all due Jan. 1st.

For additional information about this complex organization, address all inquiries to: Scott Douglas KB7SB, PO Box 46032, Los Angeles CA 90046.

CENTER OF POPULATION AWARD

The geographical population center of the USA is close to St. Louis MO. To achieve this award, work one station in each state which borders Missouri.

Work one station in Arkansas, Illinois, Iowa, Kentucky, Kansas, Nebraska, Oklahoma, and Tennessee, plus one station in St. Louis MO. Send list showing calls and log data plus \$1 to Dean Cowden KK0V, 2317 Lee St., Poplar Bluff MO 63901.

USA AWARDS PROGRAM

There is no limit to the frequency this award is issued an applicant. An applicant can work any band or mode of operation. Endorsements are \$1.00 each. Application for this awards program should be made to Scott Douglas KB7SB, PO Box 46032, Los Angeles CA 90046.

The Worked All United States Award is issued in four classes. Class AA is for DX stations only and requires the applicant to work all 50 US states. Class A1 is for domestic stations and they, too, must work all 50 states for this class of award. Class A2 requires 40 states be worked while class A3 requires 30 states be worked and confirmed.

There is a Double Worked All States Award and the only requirement here is that you work two separate stations in the required number of states for the class of award you are attempting to pursue.

Likewise, there is a Triple Worked All States Award for which you must work a minimum of three separate stations in each of the required US states.

While you are at it, consider the Worked US States and State Capitals Award. Here, points are accumulated for each state and capital city worked. A single point is earned for each. To qual-

ify for class A (DX only), 100 points must be earned. Class B requires 80 points, while class D requires 60 points.

To add insult to injury, included in the USA Awards Program is the Worked All States, Capitals, and Counties Award. Here again, the award is based on a point system. Each state is worth one point, two points are earned for each state capital city worked, and a total of ten points is earned for working all counties in a single state. Should you accumulate 600 county points, a trophy will be awarded. The class AA award is given for 600 points, class A for 500 points, class B for 400 points, class C for 300 points, class D for 200 points, class E for 100 points, and class F for 75 points.

ALL ALASKA COUNTIES

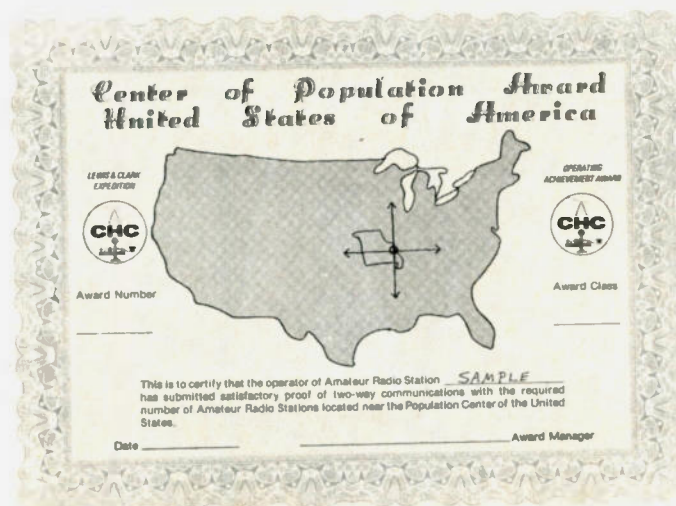

The Moose Horn Amateur Radio Club of Penai Peninsula, Alaska, announces the availability of their award for the State of Alaska. The award, in the form of a certificate, is available to licensed amateurs worldwide.

Certificates will be issued with endorsements for special modes or bands such as: class 1 (CW), class 2 (AM), class 3 (SSB), class 4 (RTTY), class 5 (mixed mode), and suffixes A (one band) and B (mixed bands). For example, certification or endorsement for an award on 20-meter SSB would be class 3A.

To qualify for this award, applicants must make four contacts in Alaska, one for each of the four judicial districts of Alaska. Of these, one contact must be made with a member of the Moose Horn Amateur Radio Club. All contacts must be made on or after August 15, 1961. It should be noted that the present system of judicial districts will be used in lieu of counties until such time that the State of Alaska adopts a system of actual counties.

To apply for the AACA, provide a list of confirmed contacts, certified by either two amateur operators, a local radio club official, or a notary public. Forward the verified list along with one US dollar or three (3) IRCs to cover air mail return of your award. All applications should be addressed to Ken Smith KL7JFY, PO Box 1682, Soldotna AK 99669.

By the way, here is a list of the
73 Magazine • May, 1982 115

members of the Moose Horn ARC: KL7EJM, EK, EKN, EKO, FG, GIC, GJY, GNP, HHF, HQK, IEL, IFX, IN, ISO, ISP, IQQ, IQP, IZH, JDR, JFY, JL, KJ, LB, LE, NH, AL7BU, WL7ACQ, AEG, AJF, WB9NES, and VE6NH/KL7.

USS LING

On May 8, 1982, the weekend before Armed Forces Day, so as to not conflict with the operations of the Armed Forces activities, the Meadowlands Amateur Radio Association will be on board the *USS Ling* (SS297), docked on the Hackensack River in Hackensack, New Jersey, and will be operating under club station call N2BMN. The operation will begin on Saturday, May 8, at 1500Z and end at 2100Z. The following frequencies will be operated throughout the day, alternative between CW, SSB, and FM:

MODE	FREQ.	BAND
CW	14.060	20m
SSB	14.310	20m
CW	7.115	40m
CW	7.060	40m
SSB	7.250	40m
CW	28.110	10m
CW	28.060	10m
SSB	28.650	10m
CW	144.100	2m
SSB	144.150	2m
FM	146.150	2m
FM	146.550	2m

For confirmation of QSO, please send a large SASE (8½" x 11") to Ralph Francavilla N2BMN, 154 Redneck Avenue, Little Ferry NJ 07643.

NETHERLANDS-AMERICAN BICENTENNIAL

The Holland (MI) Amateur Radio Club will operate K8DAA plus other participating stations for the Netherlands-American Bicentennial during Tulip Time, May 12 through May 16, 1982. Operations will be in all phone bands and possibly some CW. One contact with K8DAA (club station) or two participating stations qualifies for a certificate. QSL to: HARC, PO Box 92, Zeeland MI 49464.

ARMED FORCES DAY

This year's observance of Armed Forces Day will include the operation of an amateur radio station from the United States Air Force Museum at Wright-Patterson Air Force Base, near Dayton, Ohio. Operating under the callsign K8DMZ, the station will be on the air from

1400Z to 2200Z on Saturday, May 15th. Operators will work primarily in the General class phone segments of 75, 40, 15, and 10 meters with periodic CW excursions to the Novice sub-bands. FM and SSB operations on 2 meters also are planned. The specific frequencies to be used will depend upon existing band conditions. To commemorate the event, the Museum will issue a special certificate for each two-way contact. This will be the first time an amateur radio has operated from the Museum in conjunction with a special event.

First established in 1923, the United States Air Force Museum is the oldest and largest military aviation museum in the world. It is located six miles northeast of Dayton at historic Wright-Patterson Air Force Base and is close to the Huffman Prairie site where the Wright Brothers conducted many experimental flights following their first successful powered flight at Kitty Hawk, North Carolina.

For further information, contact: Mr. Joe Ventolo, USAF Museum, Wright-Patterson AFB, Ohio 45433, (513)-255-3284, or the Museum's Public Affairs Officers, Dick Baughman or Linda Smith.

GATEWAY TO THE WEST ACHIEVEMENT AWARD

Work stations in states through which the Lewis and Clark expedition passed. Work one station in each of the following states: Idaho, Kansas, Montana, Nebraska, North Dakota, Oregon, South Dakota, and Washington, plus one station in St. Louis MO. Send list showing

calls and log data plus \$1 to Dean Cowden KK0V, 2317 Lee St., Poplar Bluff MO 63901.

CAPE HATTERAS LIGHTHOUSE I

The weekend of May 15 and 16, the Rockingham County ARC will be operating from the Cape Hatteras Lighthouse on the outer banks of North Carolina. This lighthouse, which at 208 feet is the tallest brick lighthouse in the country, is designated as a national historic landmark and is seen by over a million visitors each year. But this beautiful sentinel is in danger of falling victim to the Atlantic's turbulent forces. Once 1500 feet from the shoreline, it now stands less than 70 feet from the water—despite various efforts to control the erosion.

The RCARC hopes its mini-expedition will help to draw national attention to this graceful and historic landmark. Operating frequencies will be 30 kHz up from the bottom of the General portion in each band, both phone and CW.

CAPE HATTERAS LIGHTHOUSE II

When the Cape Hatteras Lighthouse was completed in 1870, it was 1500 feet from the shoreline. Today, it is 70 feet—and closing. The Cary Amateur Radio Club, Cary, North Carolina, will draw world attention to the peril of this keeper of the "graveyard of the Atlantic." On May 29-30, whether the lighthouse is still standing or not, Cary ARC members and friends will put two HF stations on the air from a site close to "the big candle." The targeted time for operation is 9:00 am (1300Z),

Saturday, May 29, to noon (1600Z), Sunday, May 30, 1982. Operation may start sooner and last longer, depending on conditions and people power.

Planned frequencies for operation are: CW-3552, 7052, 14052, 21052, and 28052 kHz; SSB-3988, 7288, 14288, 21388, and 28588 kHz. The callsign will be NB4L (New Blood for Lighthouse).

Every station making a contact with NB4L during the special event can receive a commemorative 8.5" x 11" certificate by sending an appropriate SASE (1 oz., folded or unfolded) with QSL card containing the correct log information to Chuck Davis NB4L, 304 Atchison St., Garner NC 27529.

There is a public effort to raise funds to save the Cape Hatteras Lighthouse from the onslaught of the Atlantic. While many of the Cary ARC members may favor that project, this special event is only meant to focus attention on the peril of the Lighthouse. There is no connection with any fund raising.

SECOND ANNUAL COMMEMORATION OF MT. ST. HELENS ERUPTION

W7AQ, the Yakima Amateur Radio Club, will operate a special event station in commemoration of the second anniversary of the eruption of Mt. St. Helens in Washington State.

On May 18, 1980, at approximately 8:32 am local time, Mount St. Helens, located in southwestern Washington State, erupted violently. The 9677-foot summit was reduced to 8364 feet. A crater 2100 feet in depth was produced. Over one cubic mile of matter was thrown into the atmosphere.

Yakima, Washington, is located 80 miles northeast of the volcano. W7AQ was starting its hamfest activities that morning. By 10:30 am, the sky became as black as midnight. The light of the sun would not be visible until the next day.

Over 600,000 tons of volcanic dust and ash, which covered the city of 50,000 up to one inch in depth, was removed by cleanup over the next several weeks.

Join us in commemoration from May 16 at 1800 to 0200 of May 17 UTC. Frequencies will be 25 kHz up from the bottom of the General phone edge, ± QRM and band conditions. CW will be up 25 kHz from the Novice band

edge, \pm QRM and band conditions and at 14.050 \pm QRM and band conditions. A QSL will be available for an SASE. Send QSLs to: W7AQ, Yakima ARC, PO Box 9211, Yakima WA 98909.

MEMPHIS TN

The Memphis (TN) Radio relay Club will operate on May 22 and 23, 1982, for a weekend of the sixth Memphis in May Festival. Frequencies: CW—7,125 kHz \pm QRM and 14,180 kHz \pm QRM; SSB—7,280 kHz, 14,305 kHz, 21,400 kHz, 28,650 kHz, and 146.52 MHz \pm QRM. Operating hours: 1400-2000 UTC, May 22, and 1200-1800 UTC, May 23, 1982. Special certificates will be issued for confirmed contact and large 9" x 12" SASE sent to N4ERU or N4CWS, 2071 Victoria, Memphis TN 38116.

PORT JERVIS, NEW YORK

The Orange County ARC will operate WB2TSA to celebrate the tenth anniversary of the club and the diamond jubilee of the city of Port Jervis, New York, on May 29 from 1400-2200 UTC and May 30 from 1400-2000 UTC.

Frequencies 10 kHz up from lower general phone bands. QSL for SASE to OCARC, PO Box 434, Cornwall-on-Hudson, New York 12520.

DOGWOOD FESTIVAL QSO PARTY

The annual Dogwood Festival celebrated in Fairfield, Connecticut, will also be observed on the air by members of the Greater Fairfield Amateur Radio Association with its Dogwood Festival QSO Party on Saturday, May 8th. Members of the club will operate on six amateur bands with the club call WB1CQO and explain the significance of the festival, which marks the blossoming of the 30,000 pink and white dogwood trees in the town of 55,000 persons. Fairfield's Dogwood Festival began in 1936, although the original trees were imported from Japan in 1895 and earlier. Thousands of visitors flock to see the pink and white blossoms in full bloom during May.

WB1CQO will be on the air May 8 from 1300-2200 UTC (9:00 am to 6:00 pm) EDST. A

special commemorative QSL card will be available to confirm each QSO.

Dogwood Festival stations will operate on these SSB frequencies: 3.975, 7.235, 14.330, 21.420 and 28.710 MHz. FM operation: 146.55 simplex.

Special QSLs will be sent upon receipt of an SASE or IRCs to QSL manager Grace von Stein KA1JT, 248 Euclid Avenue, Fairfield CT 06432, USA.

BISHOP MULE DAYS

The Bishop (CA) Amateur Radio Club will operate KA6AMT from the mule capital of the world, Bishop, California, on May 31st in recognition of the annual Bishop Mule Days celebration.

Frequencies: Phone—3.905, 7.240, 14.295, and 146.34/94. Certificate for a large SASE sent to Bishop Amateur Radio Club, PO Box 1024, Bishop CA 93514.

TIMBUCTOO

A special event station will be operated by the Yuba-Sutter Amateur Radio Club from the historic gold rush town of Tim-

buctoo, located in the mother lode country of California's Sierra Nevadas. Listen for call-sign N6DDP from 1700Z May 15, 1982, to 0100Z, May 16. For a commemorative QSL, send an SASE to Y-S ARC, PO Box 1169, Yuba City CA 95992. Frequencies: 28.620-.630, phone; 21.150-.160, CW; 14.310-.320, phone.

MOSCOW OLYMPICS

The Moscow, Tennessee summer "Olympics" will be held in Moscow on May 14, 15, and 16, 1982. Communications for this annual event will be provided by the Mid-South VHF Club of Memphis. A special events station, KU4K, will be operating SSB from the site on 28.8, 14.28, and 7.2 MHz. There will be an OSCAR station in operation as well. Amateurs contacting KU4K are invited to QSL via Box 88, Moscow TN 38057. The summer Olympics is a benefit educational fund for the children of the men who lost their lives in the aborted Iranian hostage rescue attempt. Last year over \$30,000 was raised for the benefit of approximately 17 children.

W2NSD/1 NEVER SAY DIE

editorial by Wayne Green

from page 8

against the speed of the brain and are stopped.

Once this limitation was understood, it made sense to stop trying to learn code with the old system. Articles were written about it and new code courses devised to get around that old slow method and the resulting plateau. I tried to get the ARRL to recognize the futility of their old system but got nowhere. Hams had always learned code that way and they were not going to change.

After giving up on the ARRL trying to help hams learn the code, I sat down and made up my own code tapes, using the new, much faster and easier, learning system. I brought these out on cassettes as the 73 Blitz

Code Course. I soon was getting letters from thousands of new hams thanking me for breaking the situation for them. Many had tried and tried the ARRL tapes and had thought they were never going to learn the code. Now they found that within a few hours they were on top of it.

My "Genesis" cassette starts off the beginner with the simplest of code characters, starting with E, I, S, and H. Then, instead of going on to the rest of the 26 letters, I immediately start sending simple words. These characters are each sent at 13 wpm speed, right from the start, thus reinforcing the sound of the character. The letters are spaced for five wpm copying.

The quick change to sending words gets the student used to success. Simple messages are

being copied within minutes of starting to learn the code. This is a tremendous psychological boost.

The first one-hour tape teaches all of the letters, numbers, and punctuation marks, complete with some cute messages to make the learning experience fun. Many people are thus able to master all of the needed characters within a couple of hours of work with this tape.

The next step is my "Stickler" tape. . . again with all characters sent at 13 wpm speed, but spaced for six wpm throughout. By standardizing on 13 wpm sound patterns, the groundwork is laid for passing the 13 wpm exam. The "Stickler" is all five-character code groups and has been designed by me to be as frustrating as possible. By the time you are able to copy this code tape 100%, you should be able to breeze through any FCC exam for 5 wpm, half drunk and in your sleep. Many hams tell me that by the time they can handle this nasty tape they can copy 13 wpm of clear text with no problems.

I want to be sure that my students are overtrained. The test,

particularly if it is in front of an FCC examiner, can throw even a normal person into panic. Well, there is nothing which calms the nerves as much as sitting down to do a code test and having the code sound like it is coming at two wpm. It's all in the psychology.

For the next test, I have the most miserable tape you've ever heard. The "Back Breaker," at 14 wpm, will drive you right up the wall. You won't believe what a bastard I am until you try my "Back Breaker" tape and suffer. Heh, heh. But again, when you sit down for 13 per in plain text you will not believe how slow it sounds. Many students start laughing when they hear it, losing all their tensions.

Every now and then someone writes in asking for a copy of the code groups on my cassettes. I flatly refuse to send them a copy. The reason is simple. . . I don't want them using the tapes to test code-copying speed. The system is to use the tapes, picking out the characters you recognize. You keep working at this until you automatically copy all of them. You'll know full well

when you miss one, so you don't need a cheat sheet to check. I want you to practice without the pressure to perform. Such pressures take all the fun out of code. Learning the code should be and can be fun. The more you can do to make it fun, the faster you are going to learn it. The more pressure you put on yourself, the longer it is going to take and the more unpleasant it is going to be.

The fact is that a skill with the code is a lot of fun to have. I'm hoping that we can eliminate the pressures entirely by getting the code test out of the ham license requirements, replacing it with a technical exam which means something. Then I think we will have a lot more hams developing their code ability... and enjoying it.

For the Extra class license, I have a 21 wpm cassette. Once you can handle this one you will be able to copy plain language at almost 30 wpm.

From a practical point of view there is little difference in learning the code at 13 wpm, 20 wpm, or even 50 wpm. The process is about the same and the length of time it takes to master any of these speeds is about the same. We have had some interesting experiments with starting newcomers right out at 50 wpm... and succeeding!

The 73 code courses are available from us by mail order. They are also stocked by most ham stores. These stores are still selling the ARRL course... the one which I feel has lost us several hundred thousand hams. Many clubs are still taking hour after hour, struggling with the 1930s code system from the League. Modern ideas sure are difficult to get across.

FIGHTING BACK

Every now and then I get a stroke of inspiration. The other day, while I was sitting in the lounge of a restaurant waiting for my name to be called to get a table, a chap next to me started smoking a cigar. Being, as you may know, a non-smoker, I had immediate need of a gas mask. Cigarettes are annoying, but a cigar or pipe is just too much. I got up and went to another restaurant.

There must be some way to

fight back. There really has to be a way. That was the train of thought that brought on one of my all too few strokes of semi-genius. If these turkeys can stink up the air I have to breathe, what's wrong with me stinking right back at them? How about an aerosol can of stink?

The first thought was to see about getting some cans of methane. Then I could sort of spray it and pretend that I fired back with a built-in weapon. But, alas, that might get ignited by the cigar or pipe and blow both of us to smithereens. No, the stink should be as offensive, but not be explosive. Perhaps skunk juice or hydrogen sulphide (rotten eggs). Yes, that would do it.

Put out in small pocket-(purse-) sized cans, I think it would sell. We might call it FIGHT BACK. It would be the first way for non-smokers to even the score. At \$1 a can, it should sell well, Hmm, I'll have to look into this.

FOREIGN AID

One of the great benefits of amateur radio is that it allows us to sit and talk at length with hams in foreign countries. Unfortunately, few of us take the time to try to get to know amateurs in other countries, which is both our loss and theirs. Most of us are so swept up with contests and working countries that we say to hell with the chap at the other end.

I remember when I first moved to New Hampshire and went on the air. I found myself being called quite often by hams "needing New Hampshire." This quickly got to me. These chaps had no interest in me or in New Hampshire. All they were interested in was a QSL card. Now what is the possible value of a card from someone you didn't even bother to do more than casually bump into on the band? Hams needing New Hampshire seem to go out of their way not to get involved with any real conversation. They are almost always uninterested in paying any dues for the card in the way of an interesting contact. The QSL card is supposed to be the final courtesy. In this case, it is often the *only* courtesy involved.

Amateurs in all foreign countries run into this syndrome. In

the rare ones, they seldom run into much else. If they get fed up with non-contacts with hams in search of their pasteboards and start making contacts by calling some of the stronger stations... or hams they know... the hunters make their lives miserable with break-ins, tail-endings, and the like. If ignored, these QSL hunters can get vicious. This can diminish the fun of amateur radio substantially.

There probably isn't much that can be done about this whole lousy situation as long as the fascination continues for being high on the ARRL Honor Roll. Can I call it a dishonor roll?

At any rate, if you should want to fight the self-destructive urges to treat DX operators as mere QSL factories for your collection... providing you with an ever higher listing on an occasionally printed list in an obscure magazine and not much else to show for a lifetime of DX-ing... then perhaps you can join me in finding out that many DX hams are highly interesting people. I can tell you this: Once you start talking with them, you are sure to become addicted to it.

You know that in a country where there are from one to ten hams you are not likely to be talking with a blue-collar worker. It is highly likely that you will be talking with a relatively important or wealthy person. He is also likely to be particularly interesting, if you can get him to talk.

One of the conversational openers which I've found to work has to do with asking about their country. From there, I just sit back and listen. You know, it wouldn't hurt you to invest in one of the almanacs and read up on some of the smaller third-world countries so that you'll have some questions to ask which show more than a casual interest.

One of the subjects which may interest you has to do with aid funds the country is probably getting from ours. This can bring about an interesting conversation in some cases... and embarrassed silence in others. I have the advantage of getting around to visit hams in many of the third-world countries, so I ask about foreign aid when I visit them... and find many open

to give vent to their feelings about this.

Since this is where I was heading when I started, it isn't exactly a digression. This business of foreign aid has been bugging me for a long time. The way the situation is set up right now, this money is wasted for the most part. It doesn't have to be.

As I wrote recently, the heads of a great many of the third-world nations are kept in position by virtue of the money they are able to grab for their supporters. Even the poorest of countries can be bled further by these pirates. But they are expert at working on the sympathies of the wealthier nations to get aid funds. The US is a particularly good sucker for this. Rarely does even 10% of this "aid" money accrue to the benefit of the poor people of the countries.

Presuming that Uncle Sap is going to continue to try to buy friendship (a commodity which seemingly can't be bought) with handouts, we could at least send aid which would be more difficult to turn into cash and at the same time provide some feedback of the money to US industries. My proposal is for future aid to take the form of goods, not cash, and that this should be goods from small business manufacturers rather than the big corporations. That would keep most of the lobbyists out of the pork barrel.

When we send cash, the most desired commodity, to these countries, most of it ends up in Switzerland without even coming near the people for whom it was intended.

Getting back to amateur radio, as you talk with the DX amateurs I think you'll find them enthusiastic for you to visit them. And I've found that a surprisingly high percentage of these amateurs manage to get to the US now and then. See if you can get them to include a day or two visiting you. Then you'll be able to find out a lot of things which they really couldn't talk about over the air.

Remember that 97.1e has to do with your ability to contribute to international goodwill. Pile-ups and tail-ending are not likely to do this. Presenting the friendly face of America to the world will. It's up to you whether we look like ugly Americans or not.

LETTERS

"CRACK THE WHIP"

First of all, I do enjoy your magazine and respect your right to an opinion on various topics (although sometimes I disagree), but on this business of a code-free license, I must make an objection.

I don't understand how Japan can have so many more amateurs than the US when the current *Callbooks* don't support this statement. But regardless, I will accept your word as you are in a better position than I am to know.

In my opinion, the reason why the US is declining in new engineers and high technology is because the youth of America is not made of the same fabric as that of our oriental brothers. At age 30, I am currently enrolled in an electronics program at a local community college and it is my impression that most of the "fresh-out-of-high-school" crowd are there merely because of parental pressure to get a degree. This school has one of the most thorough and modern electronics programs in the state and can compete equally with any big university on the educational level.

But the fact still remains that most of the younger students are "just going for a degree" and could really care less about the field they are pursuing. Possibly at one time they happened to open up a transistor radio, marveled at how it could do what it does, and decided this would be a less boring field than, let's say, social science or psychology.

The Japanese seem always to do things a little better, kind of a oneupsmanship, if you will, than their counterparts of the west. It is because they want to, Wayne... not because someone is standing over them with a whip!

If there is a minute problem with lids in Japan, what with their code-free licensing, that doesn't necessarily mean the same will hold true here.

You have stated that our technology could be much improved by technicians and engineers that were "sparked on" by being exposed to amateur radio during their youth. Well, if this is the

case, then why didn't this happen with the Citizens Band service of the past? You couldn't have an easier way to get a ticket and get on the air than just to send off to the FCC for an instant license. Granted, a lot of superior hams graduated from the CB ranks and a lot of them probably went on to become technicians and engineers, but you know as well as I that the overwhelming majority did not. And look what the CB service is now without the *discipline!* Notice the emphasis on the word discipline? Learning code is a matter of discipline, period! There is no other word for it; that is it, in black and white. The Japanese are disciplined. As a matter of fact, they are noted for it. Maybe that is why they can handle a code-free licensing program without any problems.

How would you compare American youth to Japanese youth? Is one better than the other? No, but one is more disciplined. In WWII, we destroyed Japan and rebuilt it and, as a consequence, they became more disciplined. Given that fact, who do you think would be more arrogant? We have enough arrogance on the bands already. Let's try to get more discipline on the bands and not open up the floodgates for more arrogance. I don't think your theory holds too much water, Wayne. I teach new Novices and they can learn the code and enjoy doing so. It's just a matter of presentation and a little discipline.

It's been a while since this country has led the industry and I'm afraid it will be a lot longer until we can change the attitude of the people, especially that of the youth. Besides, if the overwhelming majority of hams today don't prefer a code-free license, why fight it? This is supposed to be our service, isn't it? We should have some say about how we want it! There will always be enough people to keep us a viable commodity on the FCC "exchange." And those are the ones we want. *Disciplined!*

**Dave Peckham KD9D
Decatur IL**

Dave, such a bunch of questions! Good ones, though, so let

me tackle them one at a time. First, regarding the Callbook. If they listed only the Extra class US hams, the US Callbook would be small, too. The Japanese Callbook is huge because they list all classes of licensees...over half a million of them. Now, about American kids and technology...the magic happens in the teen years. In the past, about 75% of the new hams were teenagers, with the old ARRL polls showing 50% being either 14 or 15 years old. There is now and there always has been an enormous difference between the type of engineer we get from dedicated teenage hams and from people who decide to just go for a degree. That's the same now as it always was and the chap who goes for a degree is usually a grave disappointment by comparison. Boy, I've known a lot of 'em.

Now about CB. Dave, think about it...the mess is awful, with piles of interference, contacts which are even more boring than most ham contacts (yes, I know that's hard to believe), bodacious signals, and so on...how do you honestly expect anything good to come from such an incubator? The few CBers who managed to be salvaged by friendly hams are a blessing to us and to CB, but they are few, with most of those exposed to CB recoiling from the gore. No, there is a world of difference between an interference-hassled contact on one of the CB channels and a half-hour rag chew with someone in Germany or Australia, so please don't try to equate the two in your mind.

The Japanese aren't any better than we are. They just went the right way when we went the wrong with that foolish attempt to return to prewar Class A and B licensing in 1963. We now know how to fill our bands with crazies...use a code test and let Bash do away with the technical requirements with his books and blitz one-day memorization bashes. If you want garbage, you know how to get it. And Dave, remember that in 1969 the overwhelming percentage of the hams hated two-meter FM and didn't want to read about it or hear about it. Every now and then amateur radio needs someone to provide some leadership. I've found that in the long run people (even hams) will think things through and eventually

get away from slogan thinking and work for what is in the long-range interest of amateur radio. We really couldn't ask for more proof that the code is a total failure as far as keeping out the nitwits (my apologies to any nitwits reading this and taking offense...which is an unlikely prospect) out of the hobby. Now that we have a way to easily cheat on the technical test, all we need is a way to cheat on the code and you have what you asked for: open sesame. I want to throw out the proven loser, code, and substitute a meaningful technical entry exam...one that can't be bashed.

If we get our spirit up, we can beat the hell out of any country in the world...including Japan. We can out-invent them, out-produce them, and out-quality them...if we decide that it is important to us. I want to get this started by getting kids infected with the ham bug when it is the easiest to pass along this infection: in high school. Dave, if we can get even half of the ham clubs to get some enthusiasm for selling amateur radio...classes...monitoring systems to keep our bands clean...emergency cadres so we will be ready to provide quick service for any kind of emergency...pressures on our high schools to start and support ham clubs...we'll be able to change the world in ten years. Or we can sulk and let amateur radio rot away the way it has for the last few years. Your choice. — Wayne.

CATCHING THE DREAM

Wayne, your editorials always ring my bell. You have the best interests of amateur radio at heart — we know that. I admire your business acumen; you are a true pioneer. I met you a couple of times at Dayton and enjoyed your magnetic and energetic personality.

Yet, agreement we don't have. You constantly compare American and Japanese amateurs to our disadvantage. Each has different goals and attitudes. The civilizations are vastly different. Japan may have no code requirement for entering amateur radio, but many Japanese amateurs are competent CW operators. I just don't believe our declining ranks results from the code requirement.

With that out of the way, what makes a prospective American

radio amateur stick with it, become a ham, and advance in rank? It's not the presence or absence of a requirement. It's the degree of personal drive inherent in the individual as well as how he latches onto the opportunities that come his way. As I see it, Wayne, if he is interested, he will keep at it until he makes the grade.

If Johnnie is let off from learning how to read, Johnnie is going to be let off from mathematics and a lot of other school requirements. From what I have seen of the Japanese civilization, Hiko and Toshio are not passed for non-achievement in school. Japanese education is strict and no-nonsense.

I learned Morse code in the Boy Scouts; my high school supported an excellent radio club. While a senior, I was permitted an operating hour daily in the club station as long as my grades were up. True, I had advantages, but I made use of them and passed my exams fair and square fifty years ago. Passed my Extra class thirty years ago.

Continue to agitate against the code requirement, Wayne, but I don't think it will stop the young in heart who have really caught the dream.

**Paul L. Schmidt W9HD
Bloomfield IN**

Paul, I agree with you. I don't think the code has much to do with our declining ranks. I think that if we can get the kids exposed to amateur radio rather than CB...or drugs...we'll get into climbing ranks. The code is a loser as far as separating the wheat from the chaff. We need to get back to having this a technical hobby. If we insist on hams having an understanding of radio instead of merely having to pass a stupid code-skill test, a test which has flooded us with dregs from the pits...we might be able to look for some progress and have more pride in our hobby and hams. The cretins who are screwing up amateur radio are naturally repelled by 73, so I can write freely about them. You are right about education, too...there is much to be said for some of the no-nonsense Japanese approach as opposed to the Dr. Spock permissiveness which we have fallen into over the last twenty years. Every psychological survey shows that kids respond better to much stricter guidelines...and are

happier. But that would force the average parent to look up from the television set now and then...so forget it. No, if we're going to get kids out of the mess they're in, we're going to have to trap them with the fun of amateur radio...the fun of talking with the world...the fun of building...the fun of learning...of experimenting...of doing things few others can do. I feel this is a tremendous resource and should be used to change our country and give it back some pride. — Wayne.

CALL FOR PAPERS

Papers are invited for the 1982 Annual VHF Conference to be sponsored on October 23, 1982, by the Electrical Engineering department, Western Michigan University. Principal emphasis will be placed on engineering developments applied to radio communication, design, and construction on the frequencies of 30 to 1200 MHz. Papers on a wide range of subjects are solicited including, but not necessarily limited to, these:

- Antennas and transmission lines
- Applications of microprocessors
- Audio-frequency equipment used with VHF transmitters and receivers
- Emergency gear
- Grounding and shielding
- Keying, break-in, and control circuits
- Measurements and test equipment for VHF
- Mobile and portable equipment
- Modulation and mixing
- Narrowband voice modulation
- Noise reduction
- Phase-locked loop uses
- Picture transmission and reception
- Power supplies including switchers
- Production technology and model building
- Propagation
- Recent equipment/new apparatus
- RTTY
- Satellite and Moonbounce topics
- State-of-the-art semiconductors, ICs, and filters with applications
- Transceivers

One of the basic purposes of this Conference is to provide a maximum opportunity to present findings by those experimenting, designing, construct-

ing, testing, and inquiring into problems and methods applicable to VHF radio. This is an opportunity for beginning or mature researchers to report their findings to their peers. We especially encourage the inexperienced inquirers to obtain some experience by presenting a paper at our VHF Conference.

Authors wishing to present papers should send a synopsis or abstract (typically one or two pages with diagrams) describing the paper to Dr. Glade Wilcox W9UHF, Chairman, VHF Conference, Department of Electrical Engineering, Western Michigan University, Kalamazoo MI 49008. Foreign authors are requested to have a US contact.

Deadline for submission of synopses is June 30, 1982. Speakers will be notified of acceptance by July 4, 1982. Reproducible copy for the printed proceedings should be mailed to the Chairman two weeks prior to the day of the Conference.

**Glade Wilcox W9UHF
Kalamazoo MI**

ELMER LIVES

After reading the November, 1981, issue, and noting the letters to the editor from Frank D. Windsor and Tom Taorimina, I felt that I could no longer be silent. I am an aspiring Novice who hopefully will have upgraded to General by the time you receive this.

I became interested in ham radio as a youngster, but did not have the time necessary to devote due to college, medical school, residency, and then early struggling years of practice. In November, 1981, I learned the code and began to study theory. I immediately ran into problems, and needed to discuss my problems with someone more knowledgeable than myself. One of my patients (N9ATB) overheard my predicament and offered his services. Within two weeks, he had guided me past all of the rough spots; frequently he allowed me to listen and observe at his home while he made QSOs. He administered my Novice examination for me in early January.

As I progressed and started to increase my code speed, several other hams became known to me. I also discovered that another physician in my community was a ham. KB9DD has spent many hours working with me

and has even made practice QSO tapes for me so that I could become more proficient at code and be really ready for the General exam. His assistance has been invaluable to me.

Through people like this I have come to truly appreciate the amateur radio spirit. I am no babe-in-the-woods: I have heard the foul language on 20 and am aware of the other problems that Frank and Tom illustrate, but I am certainly not convinced that things are as bad as they say. Elmer is sure alive and well here. All of the hams I know are courteous, helpful, and represent their hobby as true gentlemen. It is my privilege to join their ranks. I only hope that someday I can provide as much help and encouragement to a potential licensee.

**Gregory L. Darrow, M.D.
Janessville WI**

CHEAP-SCAN!

I read your article by Jeff DeTray WB8BTH regarding memory scan for the TR-9000. I am the owner of one myself and, like Jeff, realized to top off a great rig surely Kenwood could have had a memory scan. Well, here's the bottom line: the TR-9000 does have a memory scan; they just haven't brought the function out to a control! I sympathize with Jeff. His memory scan cost him \$39.95; mine cost the price of one silicon diode, two pieces of wire, and some thinking.

The TR-9000 is microprocessor-controlled. (At this point, get your TR-9000 manual out.) Find the circuit diagram of board X53-11G0-11. (If you don't have a manual, rip the lid off your rig and remove the front control section by removing 4 screws, 2 on each side — allowing the front section to be moved to see and work on the board behind it.) Note Q15, the microprocessor; now all you have to do is connect pin 13 (PE-1) through a silicon diode to pin 38 (PB-1). Obviously, you won't want the scanner running continually, so a switch is needed. As some of the switches on the TR-9000 are DPDT and only used as SPST, I used the unused side of the NB switch.

Trace PE-1 + PB-1 on the board 'til a suitable pick-off point is found. Then remove the front panel, remove the power/volume control, and you will see

on the circuit board where one side of the NB switch is not used.

The result is that when NB is out, the scanner is in and can be controlled by scan and hold buttons manually. And when a signal is present, it will stop until it ceases, and then continue. If mike P/T is operated, the scanner will stop and has to be restarted manually by pushing SCAN on your rig.

A simple addition to a fine rig.

Tasmania, Australia

FAR SCHOLARSHIPS

The Foundation for Amateur Radio, Inc. (FAR), a nonprofit organization with headquarters in Washington DC, plans to award nine scholarships for the academic year 1982-1983. The Foundation, composed of fifty local area amateur radio clubs, fully funds two of these scholarships from the proceeds of the Gaithersburg (MD) Hamfest. It administers, without cost to the donors, two scholarships for the Quarter Century Wireless Association and one each for the Richard G. Chichester Memorial, the Radio Club of America, the Young Ladies' Radio League, the Edmund B. Redington Memorial, and the Amateur Radio News Service. The last-named award is new this year.

Radio amateurs holding at least an FCC General class license or equivalent may compete for one or more of these awards if they plan to pursue a full-time course of studies beyond high school and are enrolled or have been accepted for enrollment in an accredited university, college, or technical school. The scholarship awards range from \$300 to \$900, with preference given in some of them to residents of specific geographical areas or the pursuit of certain study programs.

Additional information and an application form can be requested by a letter or QSL/postcard postmarked prior to May 31, 1982, from me.

The Foundation is devoted exclusively to promoting the interests of amateur radio and to the scientific, literary, and educational pursuits that advance the purposes of the Amateur Radio Service.

WOODPECKER REFORMED?

Over the past several months, the amateur bands have experienced to a varying degree deliberate interference that has acquired the label "The Woodpecker."

I have read of efforts to have this interference eliminated, by political and non-political bodies. However, all efforts in the past have not been effective. Based on the old-time adage of "if you can't lick them...", perhaps we could take advantage of this activity.

There are various propagation indicators and forecasts to aid amateurs in their efforts to communicate. Why cannot the Woodpecker be used in the same manner? It should certainly provide band-opening information, at least in some direction.

I wonder, if worldwide attention were given to this activity on a scheduled basis, perhaps the instigators of this noise might feel they are contributing too much to the welfare of others. When WWV and others give the solar-flux index, they could also give the "Woodpecker: forecast for various frequencies and times." I'm sure this information is being kept somewhere; let's put the Woodpecker to good use!

FCC SPELLING

This is in reference to the letter from Bill Crowley on page 121 of the February, 1982, issue of *73 Magazine*.

There are no incorrectly spelled words in any of the Morse code tapes which the FCC uses to test amateur radio operators. The word "Springfield" is contained in some of the tapes, and it is spelled correctly, not with a "C" as Mr. Crowley alleges.

After the publication of Mr. Crowley's letter, the cassettes used by the Boston office were double-checked to see if the tapes had somehow been garbled or partially erased. It was found that these tapes are in good condition.

I regret that Mr. Crowley felt it necessary to encourage others to complain about a situation which does not exist. The Commission continues to make

every possible effort to ensure that the amateur radio examinations are unambiguous and straightforward.

Vernon P. Wilson
Chief, Regional Services Division
FCC
Washington DC

Now we have heard the FCC's side of the story. What has been your experience? — N8RK.

A MATTER OF CHOICE

Sorry, Wayne, but Jim Owens W5FQE's letter (January, 1982) hit the nail on the head. My wife renewed last year's subscription only because she got it mixed up with QST.

Mitch Armstrong W7CDM
Puyallup WA

This letter was forwarded to us by QST. — Ed.

ATLANTA SCHOLARSHIPS

The Atlanta Radio Club announces that three (3) cash \$500.00 scholarships will be awarded to graduating high-school seniors who enter an accredited college or university in the fall of 1982. Recipients must be duly licensed amateur radio operators at the time of application.

This is the fourth consecutive year in which the Atlanta Radio Club has been able to award scholarships to deserving amateurs. The three scholarships to be awarded in 1982 represent an increase of one additional scholarship over past years.

For additional information and application forms, write to Phil Latta W4GTS, Secretary, Atlanta Radio Club Scholarship Committee, 259 Weatherstone Parkway, Marietta GA 30067.

Completed applications, along with the required high-

school transcript, must be postmarked not later than July 1, 1982.

Morris Johnson KB4IT
Atlanta GA

FATHER OF SSB?

Jeanne Hammond's excellent article, "The Father of FM," in the February, 1982, issue does not mention single sideband. I believe Major Armstrong was the first to use this type of radio communication, and I mentioned this in my book, *Radio Stations Common? Not This Kind*. If anyone does not agree with this record, would they please provide the source of the detail on who they believe was first with sideband? Major Armstrong had so many firsts that we now take for granted that Jeanne probably did not mention this one because she was concentrating on his accomplishments with FM.

Spud Roscoe VE1BC
Sambro Head NS
Canada

EYEBALL TIME

July of this year marks the 25th reunion of the VHF radio amateurs who were members of the Oklahoma Central 6-Meter Club, later known as the Oklahoma Central VHF Club. All persons who were at any time members of this group are urged to write immediately to T. W. Stevens W5VCJ, PO Box 976, Edmond OK 73083. Give him your name, address, and present call and indicate whether you are interested in attending the reunion, which will be held at the same time as but not in conjunction with the Oklahoma City "Ham Holiday."

Carl C. Drumeller W5JJ
Warr Acres OK

HAM HELP

I need a schematic and manual for a Fluke 8120A digital multimeter. I will pay for copies or will copy and return originals. Thanks.

Geoff. Chadwick KA7MKN
Box 361
Red Lodge MT 59068

I will pay any reasonable price for a manual and schematic for the Model 680-0 Itron frequency counter, or I will copy and return your original.

James Dickinson W4LLF

Richmond VA 23233

NEW PRODUCTS

PROFESSIONAL-AMATEUR ANTENNA SERIES

Valor Enterprises has introduced the Pro-Am (Professional-Amateur) line of antennas, mounts, and accessories that are compatible with the Motorola TAD and TAE mounts, a system used extensively by the amateur and commercial communities.

Four mounts are offered. The model PAS (\$11.25) is a basic surface mount that installs in a

Valor Enterprises' Pro-Am antennas.

$\frac{1}{4}$ " hole (lower left in photo). Valor's model PAS38 (\$11.25) basic surface mount installs in a $\frac{3}{8}$ " hole (lower right), while the model PAT (\$14.85) is a no-hole trunk mount (upper right). The fourth mount, model PAM (\$22.00), is a low-profile magnetic base (upper left).

The Pro-Am antennas are available in four categories. Left to right in photo: models PAQ (\$5.95), of which there are twelve versions, act as $\frac{1}{4}$ -wave whips for frequencies between 136 and 866 MHz; model PUB (\$24.50), a 5-dB collinear series, available for 440-512 MHz; model PLB (\$26.35), a $\frac{1}{4}$ -wave, base-loaded antenna that can be selected to cover any frequency in the 27-to-54-MHz spectrum, and model PHB (\$23.25), a $\frac{3}{8}$ -wave design that offers 3 dB of gain on the two-meter and 70-cm bands. (Another model PAQ is on the right.)

All models are engineered for demanding environments, featuring stainless-steel whips, nickel-chrome-brass parts, and "O"-ring seals. For more information, contact: *Valor Enterprises, 185 West Hamilton St., West Milton OH 45383. Reader Service number 482.*

KENWOOD'S TS-930S HF TRANSCEIVER

Trio-Kenwood has announced the development of a top-of-the-line, all solid-state, high-frequency transceiver, the TS-930S. Designed to cover all

Kenwood's TS-930S HF transceiver.

amateur bands from 160 to 10 meters, the TS-930S also incorporates a 150-kHz-to-30-MHz general-coverage receiver which offers excellent dynamic range. Among the more interesting features to be found on this model are an automatic antenna tuner, dual digital vfos, eight memory channels, dual-mode noise blanker, i-f notch filter, fluorescent tube display, rf speech processor, rf step attenuator, and 100-kHz marker.

Special circuitry allows the operator to adjust the i-f pass-band characteristics for rejection of interference and includes a tunable audio filter for CW reception. Power input is 250 W PEP SSB, 250 W dc on CW, 140 W dc on FSK, and 80 W dc on AM. The built-in power supply operates on 120, 220, or 240 V ac. Kenwood's newest HF transceiver will have a list price under \$2000. For more details, write to *Trio-Kenwood Communications, PO Box 7065, Compton CA 90224.*

220-MHZ ALL-MODE AMPLIFIER

Mirage Communications Equipment, Inc., has announced the release of a new 220-MHz amplifier. The C106 amplifier is a solid-state, "all-mode" amplifier designed to be used in the 220-to-225-MHz amateur band. It will amplify a 10-Watt radio to more than 60 Watts output, or a 2-Watt radio to 25 Watts out. Since the C106 is biased as a linear amplifier, it can be keyed with as little as 300 milliwatts.

Other features include remote operation with the optional RC-1 remote head, and external or internal keying circuitry. The C106 lists for \$199.95. For further information, contact *Mirage Communications Equipment, Inc., PO Box 1393, Gilroy CA 95020. Reader Service number 490.*

NO-RADIAL VERTICAL ANTENNA

Cushcraft has introduced the R3, a no-radial 10-, 15-, and 20-meter gain antenna. The R3 is perfect for limited-space applications like condominiums, apartments, mobile homes, and small urban lots. It is a $\frac{1}{2}$ -wavelength, endfed 22' radiator with remote tuning for broadband coverage.

Installation is very simple, with only one square foot of space needed. It also can be telescoped for easy carrying and storage. Because of its unique design, the R3 does not need a tower, rotator, large support mast, or tuner. For more in-

Cushcraft's R3 no-radial vertical antenna.

Valor Enterprises' Pro-Am antenna mounts.

Henry Radio's all-channel marine portable.

formation, contact *Cushcraft Corp.*, PO Box 4680, Manchester NH 03108. Reader Service number 476.

ALL-CHANNEL MARINE PORTABLE

Henry Radio is introducing a marine VHF-band portable, the Tempo M1. The M1 operates on every marine channel, both US and international, with all the necessary offsets built in. It also includes all weather channels and a channel 16 override function. Channel selection is made by a thumbwheel switch on the top panel.

Other features include a one-hour, quick-charge-type battery, permanent memory, a high-power, 2½-Watt position, and a low-power, 1-Watt position. Accessories will include a charger, holster, amplifier, and high-capacity batteries.

The Tempo M1 is available through the Marine Division of Henry Radio. The suggested list price is \$495.00. For more details, contact *Henry Radio*, 2050 S. Bundy Dr., Los Angeles CA 90025; (215)-820-1234. Reader Service number 480.

TELEREADER TERMINAL

The Hal Communications CWR-670 is a compact electronic communications terminal designed for reception of Baudot and ASCII radioteletypewriter signals as well as Morse code signals. The CWR-670 includes built-in RTTY and Morse demod-

The Hal CWR-670 Telereader terminal.

ulators and video-generation circuits. The very small size of the CWR-670 makes it ideal for applications where space is limited.

Since the terminal operates from 12 V dc, it may easily be used in locations where ac power is not readily available. The video-output screen of the CWR-670 is formatted in pages of 16 lines, 32 characters per line; a total of two page screens may be selected. The internal RTTY demodulator allows selection of three standard shifts. A parallel ASCII-printer output is also provided. The CWR-670 has a list price of \$495.00. For more information, contact *Hal Communications*, Box 365, Urbana IL 61801; (217)-367-7373. Reader Service number 483.

REPEATER CONTROLLER

Advanced Computer Controls has introduced its new micro-computer-based RC-850 repeater controller. The controller's characteristics are remotely configured by the repeater owner with highly-secure tone commands. No hardware or software changes are required to modify control operator and user codes, ID and tail messages, Morse code speed, pitch and level, and a host of other functions.

The RC-850 controller's auto-patch is based on a store/forward technique where the user

enters a phone number and the controller actually dials the phone using either touchtone™ or dial pulses. Logic outputs allow remote control of equipment at the repeater site. A voice-telemetry option adds a natural-sounding speech synthesizer with analog-measurement capability.

The controller uses CMOS logic and low-power, analog circuitry to minimize current consumption. The RC-850 is priced from \$1850. For more information, contact *Advanced Computer Controls*, 10816 Northridge Square, Cupertino CA 95014; (408)-253-8085. Reader Service number 478.

RTTY PROGRAM

The Egbert RTTY program transmits and receives RTTY without the need for any expensive interface hardware. The Apple cassette ports connect directly to the transmitter/receiver. Program capabilities include 60-, 67-, 75-, and 100-wpm Baudot and 110-baud ASCII, type-ahead buffer, canned messages, and automatic CW identification.

The program runs on the 48K Apple II and requires an Apple disk with DOS 3.2 or 3.3. The program and instruction manual cost \$42.45 and are available from *W. H. Nail Co.*, 275 Lodgeview Dr., Oroville CA 95965. Reader Service number 487.

Centurion International's flexible antenna.

FLEXIBLE ANTENNA

Centurion International has introduced a new flexible UHF gain antenna for use with handheld radios. The antenna features an endfed design and represents a ½-wave radiator with approximately 2.5 dB gain over a ¼-wave portable whip antenna.

The antenna is factory-tuned to discrete frequencies from 406 to 512 MHz and has a usable bandwidth of 20 MHz. The base is fitted with a BNC connector. Designated Style G, the new antenna ranges in length from 7 to 13 inches and lists for \$17.50. For more information, write or call *Centurion International*, PO Box 82846, Lincoln NE 68501; (402)-467-4491. Reader Service number 484.

STANDBY POWER SYSTEM

The Portable Battery Division of Gould, Inc., has announced a Standby Power System (SPS) which provides 200 Watts of emergency power at 120 volts for 20 minutes, taking over the job of supplying power within one cycle of power failure.

As long as the power is constant into the SPS, the current passes through to the computer or other device being powered. However, if power drops below 102 volts, a sensing device immediately switches to an internal battery and turns on a red indicator light. If the power outage is brief, the device will automatically transfer back to line power and recharge the internal battery. Gould's standby power

The RC-850 repeater controller.

The Gould standby power system.

system has a suggested price of \$489.00. For more details, contact *Gould, Inc., Portable Battery Division, PO Box 43140, St. Paul MN 55164*. Reader Service number 486.

MORSEMATIC KEYS UPDATE

Advanced Electronic Applications, Inc., has announced the latest generation of the MorseMatic keyer, the MM-2. The MM-2 is a full-feature, paddle-input keyer that offers virtually all the features of the MM-1 predecessor plus CMOS memory and a new price. Like the MM-1, the MM-2 offers features that include an automatic serial-number generator, an automatic beacon mode, and an automatic speed-increasing Morse code trainer mode.

The MM-2 keyer comes in an rf-protecting metal package and is powered by 10 to 16 V dc. Independent + and - output keying allows connection to virtually any amateur transmitter. For

further information on AEA's new \$139.95 keyer, write *Advanced Electronic Applications, Inc., PO Box 2160, Lynwood WA 98036*, or call (206)-775-7373. Reader Service number 491.

COMPANDOR KIT

Advanced Analog Systems has announced a design evaluation kit for the Signetics NE572 dual-programmable compandor. The kit, designated AAS572, contains a printed circuit card, integrated circuits, and all components necessary to construct a complete audio compandor.

The system consists of two compressors and two expanders. Input to the compressor section consists of a high-performance, low-noise voltage follower. The system can be evaluated with either a single 2:1 compressor or by switching the ratio selector for 4:1 compression. There is also a choice between 1:2 and 1:4 expansion. Power requirements are plus and minus

Daiwa's booster amplifier.

15 V. The AAS572 costs \$65.00 in single quantities. For more details, contact *Advanced Analog Systems, 790 Lucerne Dr., Sunnyvale CA 94086*; (408)-730-9786. Reader Service number 488.

BOOSTER AMPLIFIER

Daiwa announces a compact, lightweight amplifier, the LA2030, intended for the owners of two-meter, hand-held transceivers. It is available in three versions, depending on the power output of your transceiver. All versions can deliver a maximum of 15 or 30 Watts from 144 to 148 MHz.

The Daiwa LA2030 includes rf power metering and protection circuitry. The unit comes equipped with a BNC input and

SO-239 output. Three feet of coax and BNC connectors are included in the \$121.00 price. For more information, contact *MCM Communications, 858 E. Congress Park Dr., Centerville OH 45459*; (513)-434-0031. Reader Service number 481.

TWO-METER DRR ANTENNA

High efficiency and small size are two key features of the Comrad Industries CR2A two-meter antenna. The CR2A is an adaptation of the Northrop Direction Discontinuity Ring Radiator (DDRR). Comrad's CR2A offers vertical polarization in a low-profile package suitable for either base or mobile use. Priced at \$39.00, the CR2A is available from *Comrad Industries, 1635*

MorseMatic keyer update, the MM-2.

Comrad's two-meter DDRR antenna.

Heath's portable oscilloscope.

West River Parkway, Grand Island NY 14072. Reader Service number 477.

SATELLITE TELEVISION RECEIVER

Arunta Engineering Company has introduced the DD 3000 stereo satellite television receiver. The DD 3000 can process multiplex, matrix, and discrete modes of stereo transmission in either wide- or narrow-deviation format.

Other significant innovations include a simplified installation requiring only an RG-59 cable between the receiver and remote downconverter, which transmits i-f, LNA power, and

tuning voltage. With a suggested list price of \$2995, the DD 3000 is available from *Arunta Engineering Co., PO Box 15082, Phoenix AZ 85060; (602)-956-7042*. Reader Service number 479.

PORTABLE OSCILLOSCOPE

Heath Company is introducing its first portable oscilloscope. The IO-3220 20-MHz oscilloscope can be used for most electronic measurement and comparison needs. It offers dual-trace capability, X-Y inputs, and a special algebraic add function. The IO-3220's sensitivity allows it to measure vertical signals as low as two millivolts.

Low-power, wideband antenna.

The scope's accuracy is rated within \pm three percent on both horizontal and vertical measurements.

The IO-3220 oscilloscope is sold in kit form for \$689.95. A factory-assembled version, the SO-3220, sells for \$995.00. For more information on this portable oscilloscope, contact *Heath Company, Dept. 350-455, Benton Harbor MI 49022*. Reader Service number 489.

LOW-POWER WIDEBAND ANTENNA

Grove Enterprises has announced that their scanner

beam antenna, the ANT-1, works for low-power transmitting as well as receiving. The beam works on 144-148 MHz, 220-225 MHz, and 420-450 MHz. The average vswr is 1.6:1. Because of its highly directional design, forward signal radiation is "targeted" towards distant repeaters or base stations, increasing the range of low-power transceivers.

For more information about the ANT-1, priced at \$49.95, contact *Grove Enterprises, Dept. C, Brasstown NC 28902; (800)-438-8155*. Reader Service number 485.

RTTY LOOP

Marc I. Leavey, M.D. WA3AJR
4006 Winlee Road
Randallstown MD 21133

Last month I described what may be the ultimate in RTTY output devices: a synthesized voice. Using the new Votrax Type 'N Talk, a self-contained speech synthesizer, and a 6800 computer, this setup allows conventional RTTY to be presented to the operator not as text on a page or view screen, but as an easily understandable computerized voice, capable of pronouncing whatever is sent. This month, let's look at the programming.

The program is written for my 6800 system, which, in its current state of evolution, uses the GIMIX GMXBUG version 3.0 monitor, the GIMIX VDM, and a Smoke Signal disk system, run-

ning under DOS68 version 6.1. Along with the video board, assigned to port #4 in the GIMIX system, GMXBUG supports a printer or other output device on either port #3 (serial) or port #4 (parallel). Output vectors are provided to direct data to the VDM, printer, or both. By connecting the Type 'N Talk to port #3, as a serial device running at 1200 baud, we can take advantage of this capability in the demonstration program. Lacking this feature, as in a system using another monitor, separate video and speech output routines could be used with minimal rewriting.

The program itself follows the flowchart presented last month fairly closely. Beginning at \$0100, the first chores taken care of are housekeeping: clearing the screen, setting the

GIMIX-software-controlled bell to a high pitch and short duration, and initializing the PIA for input. The output vector is also set so that both the screen and voice are initially active.

The actual receiving loop is next down the line. The keyboard is checked for input first. If there is no data found (we will cover what happens when there is input in a little bit), the PIA is checked. The RTTY input is fed to the least significant bit of the "B" side (B0) of a PIA located in port #5. If a START pulse is not found, then a loop back to the keyboard check is executed. By the way, since we are interfacing via an RS-232-type line to the demodulator, recall that the START, which is sent as a "0" level (or space), is represented by a positive voltage. Thus, reading a "1" on the B0 line translates to a space; a "0" is mark, the resting condition.

Once a START pulse is found, a counter is set up and five data pulses are read in. The step-by-step process is covered in the re-

marks in the program source listing. After screening for case shifts, spaces (which initiate a downshift-on-space), and carriage returns, otherwise unremarkable letters are decoded in a simple indexed table lookup.

The ASCII character, once retrieved from the table, is output by way of the GIMIX OUTCHR routine. As stated above, this routine will vector to either the screen only, the printer (voice) only, or both. However, I only provide the facility within this program to select screen only or screen and voice.

Now, let's get back to keyboard input. I wanted to provide a way to give commands without worrying over accidentally hitting a key and messing something up. So, in the best tradition of secure devices, only one key is recognized while receiving: the ESCAPE key. Hitting any other key is ignored. Striking the ESC key results in two effects. A flag, called the Command Flag (CMDFLG) is set to "1". This indicates that an ESC has been

hit, and that the next keyboard input should be examined as a command character. Then the local bell is rung, to verify receipt of the ESC.

Once the Command Flag has been set, several commands will be recognized by the system. A look at them reveals: V=voice on; S=silent—voice off; C=caps mode on; D=caps mode off.

The voice on and off commands are handled by storing a \$01 or \$00 in the output vector, respectively. The CAPS mode of operation was touched on last month, but deserves another word now. In the conventional mode, CAPS off, words are pronounced as they are spelled. However, groups of letters which are unpronounceable are still attempted, no matter how mangled the effort. Thus, a typical RTTY sign off, such as "N3BRD DE WA3AJR BCNU KKKK," is pronounced...well

you get the picture if you try it yourself. To get around this problem, a CAPS mode is available, in which groups of capital letters will be spelled out one by one. This is exactly what we need in a RTTY program, and the "C" and "D" commands allow you to turn this mode on or off as needed.

One other command is recognized, by the way. Sending a second ESC will terminate the program and return to DOS. Just provides a clean getaway, if you follow me. Sending any other character will clear the CMDFLG and send nothing out to the Type 'N Talk or VDM.

Granted, this demonstration program is just that, a demonstration. But I feel it shows the kernel of a system that would be useful to many hams — especially visually-handicapped ones.

One feature of this column that many of you have ex-

pressed a particular fondness for is the range of material covered. I don't want to disappoint you, so let's go from high tech to basics. Bob Henry, a Boston MA reader, dropped me a line with two good questions. He begins by asking what a "cursor" is for. For the uninitiated, the cursor is the little box, blinking or solid, or sometimes an underline, that scoots along on a video screen just ahead of where you last typed. Why? Try to imagine a typewriter, Bob, where the whole page was somehow suspended in front of you. When you hit the keyboard the characters are placed on the page in order, but that little plastic thing that normally sits dead center, and through a hole in the center of which the typebar hits the paper, is missing. How do you know where you are? Where to space? If a new line has started? With a typewriter all that information is provided by that guide

and the position of the carriage. With a video screen, there ain't no such guide. That is what the cursor is for!

Bob's other question involves an item touched upon above: unshift-on-space. Recall that on RTTY, using five-level Murray code, two cases — letters and figures — are available. Now, if you miss a "LTRS" or "FIGS" code, the proper case will not be selected, and gibberish will result. On ham RTTY, numeral groups are rarely sent. The odds are that if a space is sent, what follows is in the letters case. Let me illustrate. If I send "DE WA3AJR IN MARYLAND," recall that the "3" is preceded by a FIGS and followed by a LTRS. If that LTRS is missed, what prints out is "DE WA3-4 8, .-46)-,\$", all after the 3 being in figures case. With downshift on space, the first space forces letters case, and "DE WA3-4 IN MARYLAND" results. Less is missed.

Program listing.

FOR THE NOVICE

NOVICE LICENSE STUDY GUIDE

by Timothy M. Daniel N8RK

NEW, UPDATED EDITIONS OF OUR FAMOUS NOVICE LICENSE STUDY GUIDE AND NOVICE STUDY TAPES

• **NOVICE STUDY GUIDE**—by Timothy M. Daniel N8RK. Here is the most up to date novice guide available. It is complete with information about learning Morse Code, has the latest FCC amateur regulations and the current FCC application forms. This guide is not a question/answer memorization course but rather it emphasizes the practical side of getting a ham license and putting a station on the air. It reflects what the FCC expects a Novice to know without page after page of dull theory. The most current information still available at last year's price. SG7357 \$4.95.

• **NOVICE STUDY TAPES**—If you are just getting started in ham radio, you'll find these tapes indispensable! This up-to-the-minute revision of the 73 Study Course is the perfect way to learn everything you need to breeze through the Novice written exam. Theory, FCC regulations, and operating skills are all covered, and you'll be amazed at how fast you learn using these tapes!

Once the test is behind you, these tapes will go right on being useful, because they are packed with the latest information on setting up your own ham station, and getting on the air.

Thousands of people have discovered how easy learning from cassette can be—order now and enter the fascinating world of ham radio! CT7300 Set of 3—\$15.95.

Scientists have proven that you learn faster by listening than by reading because you can play a cassette tape over and over in your spare time—even while you're driving! You get more and more info each time you hear it. You can't progress without solid fundamentals. These three hour-long tapes give you all the basics you'll need to pass the Novice exam easily. You'll have an understanding of the basics which will be invaluable to you for the rest of your life! Can you afford to take your Novice exam without first listening to these tapes?

SPECIAL OFFER! Both Novice License Study Guide and Novice Study Tapes \$19.95. Order NP7300.

73 CODE TAPES ANY FOUR TAPES FOR \$15.95! \$4.95 EACH

"GENESIS"

5 WPM—CT7305—This is the beginning tape for people who do not know the code at all. It takes them through the 26 letters, 10 numbers and necessary punctuation, complete with practice every step of the way using the newest blitz teaching techniques. It is almost miraculous! In one hour many people—including kids of ten—are able to master the code. The ease of learning gives confidence to beginners who might otherwise drop out.

"THE STICKLER"

6+ WPM—CT7306—This is the practice tape for the Novice and Technician licenses. It is made up of one solid hour of code, sent at the official FCC standard (no other tape we've heard uses these standards, so many people flunk the code when they are suddenly—under pressure—faced with characters sent at 13 wpm and spaced for 5 wpm) This tape is not memorizable, unlike the zany 5 wpm tape, since the code groups are entirely random characters sent in groups of five.

"BACK BREAKER"

13+ WPM—CT7313—Code groups again, at a brisk 14 per so you will be at ease when you sit down in front of the steely-eyed government inspector and he starts sending you plain language at only 13 per. You need this extra margin to overcome the panic which is universal in the test situations. When you've spent your money and time to take the test, you'll thank heaven you had this back-breaking tape.

"COURAGEOUS"

20+ WPM—CT7320—Code is what gets you when you go for the Extra class license. It is so embarrassing to panic out just because you didn't prepare yourself with this tape. Though this is only one word faster, the code groups are so difficult that you'll almost fall asleep copying the FCC stuff by comparison. Users report that they can't believe how easy 20 per really is with this fantastic one hour tape.

"OUTRAGEOUS"

25+ WPM—CT7325—This is the tape for that small group of overachieving hams who wouldn't be content to simply satisfy the code requirements of the Extra Class license. It's the toughest tape we've got and we keep a permanent file of hams who have mastered it. Let us know when you're up to speed and we'll inscribe your name in 73's CW "Hall of Fame."

— General License Study Guide —

new

FROM WAYNE GREEN BOOKS

GENERAL LICENSE STUDY GUIDE—by Timothy M. Daniel N8RK. This is the complete guide to the General License. Learning rather than memorizing is the secret. This is not a question-and-answer guide that will gather dust when the FCC issues a new test. Instead, this book will be a helpful reference, useful long after a ham upgrades to General. Includes up-to-date FCC rules and an application form. Order yours today and talk to the world. SG7358 \$6.95.

• **ADVANCED CLASS LICENSE STUDY GUIDE**—Ready to upgrade your license? To prevent retaking the FCC theory exam, you need the 73 Advanced theory guide. SSB, antenna theory, transmitters, and electronics measuring techniques are covered in detail in this easy-to-follow study guide. Special modes and techniques, such as RTTY, are also treated. An engineering degree is not necessary to master the Advanced theory—try this book before visiting the examiner's office! (Published by TAB Books previous to recent changes in FCC exam material.) SG1081 \$6.95.

FOR YOUR HAMSHACK

• **QSL CARDS**—73 turns out a fantastic series of QSL cards at about half the cost of having them done elsewhere because they are run as a fill-in between printing books and other items in the 73 Print Shop. 250 Style W—QW0250—for \$8.95; 500 Style W—QW0500—for \$13.95; 250 Style X—QX0250—for \$8.95; 500 Style X—QX0500; 250 Style Y—QY0250—for \$8.95; 500 Style Y—QY0500—for \$13.95. Allow 6-12 wks. for delivery.

• **LIBRARY SHELF BOXES**—These sturdy white, corrugated, dirt-resistant boxes each hold a full year of 73, *Kilobaud Microcomputing* or *80 Microcomputing*. With your order, request self-sticking labels for any of the following: 73, *Kilobaud Microcomputing*, *80 Microcomputing*, *CQ*, *QST*, *Ham Radio*, *Personal Computing*, *Radio Electronics*, *Interlace Age*, and *Byte*. Order 1—BX1000—for \$2.00; order 2-7—BX2002—for \$1.50 each; order 8 or more—BX1002—for \$1.25 each.

RADIO BOOKSHOP

THE 73 TECHNICAL LIBRARY

HANDBOOKS FOR THE HAMSHACK

NEW

THE COMPLETE SHORTWAVE LISTENER'S HANDBOOK, 2nd EDITION by Hank Bennett and Harry L. Helms. This comprehensive volume contains loads of new information from all over the world on the latest developments in SWL technology clubs, associations, practices and stations. A thorough guide to stations of the world by general continental area and frequency is included. BK1241 \$9.95

THE TEN METER FM HANDBOOK—by Bob Heil K9EID. This handbook has been published to help the ten meter enthusiast learn more about the many methods of conversions and tricks that are used to make existing units work better. Join the great "inkers" of the world on ten FM and enjoy the fantastic amount of fun in communicating with amateur stations worldwide on ten meter FM. BK1190 \$4.95.

THE PRACTICAL HANDBOOK OF AMATEUR RADIO FM REPEATERS—by Bill Pasternak WA6ITF (author of 73 Magazine's monthly column "Looking West") This is the book for the VHF/UHF FMer, compiled from material submitted by over a hundred individuals, clubs, organizations and equipment manufacturers. A "must have" for your ham shack shelf. BK1185 \$12.95.

— The 73 — Test Equipment Library

VOL. II AUDIO FREQUENCY TESTERS—Jam-packed with all kinds of audio frequency test equipment. If you're into SSB, RTTY, SSTV, etc., this book is a must for you... a good book for hi-fi addicts and experimenters, too! LB7360 \$4.95.

VOL. III RADIO FREQUENCY TESTERS—Radio frequency waves, the common denominator of amateur radio. Such items as SWR, antenna impedance, line impedance, RF output, and field strength; detailed instructions on testing these items includes sections on signal generators, crystal calibrators, grid dip oscillators, noise generators, dummy loads, and much more. LB7361 \$4.95.

VOL. IV IC TEST EQUIPMENT—Become a troubleshooting wizard! In this fourth volume of the 73 TEST EQUIPMENT LIBRARY are 42 home construction projects for building test equipment to work with your ham station and in servicing digital equipment. Plus a cumulative index for all four volumes for the 73 TEST EQUIPMENT LIBRARY. LB7362 \$4.95.

RF AND DIGITAL TEST EQUIPMENT YOU CAN BUILD—BK1044—Rf burst, function, square wave generators, variable length pulse generators—100 kHz marker, i-f and rf sweep generators, audio osc, af/rf signal injector, 146 MHz synthesizer, digital readouts for counters, several counters, prescaler, microwave meter, etc. 252 pages. BK1044 \$5.95.

BEHIND THE DIAL—by Bob Grove. Get more fun out of shortwave listening with this interesting guide to receivers, antennas, frequencies, and interference. BK7307 \$4.95.

THE CHALLENGE OF 160—is the newest book in the 73 technical library, dedicated to 160-meter operating. Si Dunn provides all necessary information to get started on this unique band. The all-important antenna and ground systems are described in detail. The introduction contains interesting photos of Stew Perry's (the King of 160) shack. This reference is a must for new and experienced "Top Band" operators. BK7309 \$4.95.

SSB... THE MISUNDERSTOOD MODE—by James B. Wilson. Single Sideband Transmission... thousands of us use it every day, yet it remains one of the least understood facets of amateur radio. J. B. Wilson presents several methods of sideband generation, amply illustrated with charts and schematics, which will enable the ambitious reader to construct his own sideband generator. A must for the technically-serious ham. BK7351 \$5.50.

PROPAGATION WIZARD'S HANDBOOK—by J. H. Nelson. When sunspots riddled the worldwide communications networks of the 1940s, John Henry Nelson looked to the planets for an answer. The result was a theory of propagation forecasting based upon interplanetary alignment that made the author the most reliable forecaster in America today. The book provides an enlightened look at communications past, present, and future, as well as teaching the art of propagation forecasting. BK7302 \$6.95.

TOOLS & TECHNIQUES FOR ELECTRONICS—by A. A. Wicks is an easy-to-understand book written for the beginning kit-builder as well as the experienced hobbyist. It has numerous pictures and descriptions of the safe and correct ways to use basic and specialized tools for electronic projects, as well as specialized metal-working tools and the chemical aids which are used in repair shops. BK7348 \$4.95.

THE CONTEST COOKBOOK—reveals the secrets of the contest winners (domestic, DX, and specialty contests), complete with photos and diagrams of equipment used by the top scorers. Find out how to make 150 contacts in one hour. BK7308 \$5.95.

*Use the order card in this magazine or itemize your order on a separate piece of paper and mail to: 73 Radio Bookshop • Peterborough NH 03458. Be sure to include check or detailed credit card information. No C.O.D. orders accepted. All orders add \$1.50 handling first book, \$1.00 each additional book, \$10.00 per book foreign airmail. Please allow 4-6 weeks for delivery. Questions regarding your order? Please write to Customer Service at the above address. (Prices subject to change on books not published by 73 Magazine.)

The Challenge of 160

NEW

WORLD PRESS SERVICE FREQUENCIES—by Thomas Harrington Can't wait to hear the evening news, or are you wondering about the news that you aren't hearing? Receive by Radio Teletype (RTTY) all the world news and financial happenings from the world capitols on a 24 hour a day basis. This book gives you the frequencies and times of broadcast of such news services as AP, UPI, Reuters, TASS, VOA and London Press. Also included is an Introduction to RTTY with information on equipment, antennas, abbreviations—everything you need to get started in RTTY. BK1202 \$7.95.

NEW

THE NEW WEATHER SATELLITE HANDBOOK—by Dr. Ralph E. Taggart WB8DQT. Here is the completely updated and revised edition containing all the information on the most sophisticated and effective spacecraft now in orbit. This book serves both the experienced amateur satellite enthusiast and the newcomer. It is an introduction to satellite watching, providing all the information required to construct a complete and highly effective ground station. Solid hardware designs and all the instructions necessary to operate the equipment are included. For experimenters who are operating stations, the book details all procedures necessary to modify equipment for the new series of spacecraft. Amateur weather satellite activity represents a unique blend of interests encompassing electronics, meteorology and astronautics. Join the privileged few in watching the spectacle of earth as seen from space on your own monitoring equipment. BK7383 \$8.95.

INTERFERENCE HANDBOOK—by William R. Nelson, WA6EQG—This timely handbook covers every type of RFI problem and gives you the solutions based on practical experience. Covers interference to TV, radio, hi-fi, telephone, radio amateur, commercial and CB equipment. Power line interference is covered in depth—how to locate it, cure it, work with the public, safety precautions, how to train RFI investigators. Written by an RFI expert with 33 years of experience, this profusely illustrated book is packed with practical easy-to-understand information. BK1230 \$8.95.

IC OP-AMP COOKBOOK—by Walter G. Jung. Covers not only the basic theory of the IC op amp in great detail, but also includes over 250 practical circuit applications, liberally illustrated. 592 pages, 5 1/2 x 8 1/2, softbound. BK1028 \$14.95.

OWNER REPAIR OF RADIO EQUIPMENT—by Frank Glass K6RQ. Here's a book that will teach you an approach to troubleshooting without a shack full of test equipment. Written in a narrative, non-mathematical style, it will encourage you to successfully fix your own rig problems 80 to 90% of the time. Even if you don't want to fix, you can learn a lot about how things work and fail. Add to your library and personal expertise. BK7310 \$7.95.

FOR TOLL FREE ORDERING CALL 1-800-258-5473

RADIO BOOKSHOP

ANTENNA BOOKS

PRACTICAL ANTENNAS FOR THE RADIO AMATEUR—A manual describing how to equip a ham station with a suitable antenna. A wide range of antenna topics, systems, and accessories are presented giving the reader some food for thought and practical data for construction. Designed to aid the experienced ham and novice as well. Only BK1015 \$9.95.*

VHF ANTENNA HANDBOOK—The new *VHF Antenna Handbook* details the theory, design, and construction of hundreds of different VHF and UHF antennas... a practical book written for the average amateur who takes joy in building, not full of complex formulas for the design engineer. Packed with fabulous antenna projects you can build. BK7368 \$5.95.*

73 DIPOLE AND LONG WIRE ANTENNAS—by Edward M. Noll W3FQJ. This is the first collection of virtually every type of wire antenna used by amateurs. Includes dimensions, configurations, and detailed construction data for 73 different antenna types. Appendices describe the construction of noise bridges, line tuners, and data on measuring resonant frequency, velocity factor, and swr. BK1016 \$5.50.*

● **ALL ABOUT CUBICAL QUAD ANTENNAS (2nd edition)**—BK1196—The "Classic" on Quad design, theory, construction, and operation. New 2nd edition contains new feed and matching systems and new data. \$5.95.*

● **BEAM ANTENNA HANDBOOK (New 5th edition)**—BK1197—Yagi beam theory, construction and operation. Information on wire beams, SWR curves and matching systems. A "must" for serious DXers \$5.95.*

● **VHF HANDBOOK FOR RADIO AMATEURS**—BK1198—Contains information on FM theory, operation and equipment, VHF antenna design and construction, satellite-EME, and the newest solid-state circuits. \$6.95.*

● **THE RADIO AMATEUR ANTENNA HANDBOOK**—BK1199—All about wire antennas, beams, tuners, baluns, coax, radials, SWR and towers. Clear and complete information. \$6.95.*

● **SIMPLE, LOW-COST WIRE ANTENNAS FOR RADIO AMATEURS**—BK1200—All new data and everything you want to know about low-cost, multi-band antennas, inexpensive beams, "invisible" antennas for hams in "tough" locations \$6.95.*

● **HOW TO DEFEND YOURSELF AGAINST RADAR**—BK1201—by Bruce F. Bogner and James R. Bodnar, a lawyer and radar expert. This book gives you the ammunition to challenge the radar "evidence" that usually leads to a speeding conviction. The major part of the book details the inner workings of radar—you'll become more of an expert than most police officers and judges. The remainder of the book outlines how to defend yourself against a speeding ticket—the observations, measures and testimony you must obtain to defend yourself without the help of a lawyer. The price is a lot less than a fine! \$6.95.*

THE WELL EQUIPPED HAM SHACK

COOK BOOKS

TTL COOKBOOK—by Don Lancaster. Explains what TTL is, how it works, and how to use it. Discusses practical applications, such as a digital counter and display system, events counter, electronic stopwatch, digital voltmeter and a digital tachometer. BK1063 \$9.50.*

CMOS COOKBOOK—by Don Lancaster. Details the application of CMOS, the low power logic family suitable for most applications presently dominated by TTL. Required reading for every serious digital experimenter! BK1011 \$10.50.*

TVT COOKBOOK—by Don Lancaster. Describes the use of a standard television receiver as a microprocessor CRT terminal. Explains and describes character generation, cursor control and interface information in typical, easy-to-understand Lancaster style. BK1064 \$9.95.*

WORLD REPEATER ATLAS—Completely updated, over 230 pages of repeater listings are indexed by location and frequency. More than 50 maps pinpoint 2000 repeater locations throughout the USA. Foreign listings include Europe, the Middle East, South America, and Africa. \$4.95* BK7315

THE MAGIC OF HAM RADIO—by Jerrold Swank WB8XR begins with a brief history of amateur radio and of Jerry's involvement in it. Part 2 details many of ham radio's heroic moments. Hamdom's close ties with the continent of Antarctica are the subject of Part 3. In Part 4 the strange and humorous sides of ham life get their due. And what of the future? Part 5 peers into the crystal ball. \$4.95* BK7312

A GUIDE TO HAM RADIO—by Larry Kahaner WB2NL. What's Amateur Radio all about? You can learn the basics of this fascinating hobby with this excellent beginner's guide. It answers the most frequently asked questions in an easy-going manner, and it shows the best way to go about getting an FCC license. A Guide to Ham Radio is an ideal introduction to a hobby enjoyed by people around the world. \$4.95* BK7321

WORLD RADIO TV HANDBOOK 1982, 25TH EDITION—This book is the bible of international broadcasters, providing the only authoritative source of exact information about broadcasting and TV stations world wide. This 1981 edition is completely revised, giving comprehensive coverage of short, medium and long wave. 560 pages of vital aspects of world listening. \$16.50 BK1184

SPECIAL OFFER

Chart of UNITED STATES AMATEUR RADIO PRIVILEGES

by class of license, emission type, and frequency from 160 thru 2 meters, including provision for the new 30, 17, and 12 meter bands. This 22 x 28 in. twelve-color chart is the first of its kind to be both informative and decorative. \$3.00 value, only \$1.95 with the purchase of 1 or more books from the Radio Bookshop. (Supplies limited, order now.) CH7300 \$1.95.

MICROCOMPUTER BOOKS FROM 73

How to Build a Microcomputer
...and Really Understand It

Some of the Best
edited by Emily A. Glus & Jim Parry

40 COMPUTER GAMES
from microcomputing

● **SOME OF THE BEST FROM KILOBAUD/MICROCOMPUTING**—BK7311—A collection of the best articles that have recently appeared in *Kilobaud/MICROCOMPUTING*. Included is material on the TRS-80 and PET systems, CP/M, the 8080/8085/Z80 chips, the ASR-33 terminal. Data base management, word processing, text editors and file structures are covered too. Programming techniques and hardware construction projects for modems, high speed cassette interfaces and TVTs are also included in this large format, 200 plus page edition. \$10.95.*

● **40 COMPUTER GAMES**—BK7381—Forty games in all in nine different categories. Games for large and small systems, and even a section on calculator games. Many versions of BASIC used and a wide variety of systems represented. A must for the serious computer gamer. \$7.95.*

● **THE NEW HOBBY COMPUTERS**—BK7340—This book takes it from where "HOBBY COMPUTERS ARE HERE!" leaves off, with chapters on Large Scale Integration, how to choose a microprocessor chip, an introduction to programming, low cost I/O for a computer, computer arithmetic, checking memory boards... and much, much more! Don't miss this tremendous value! Only \$4.95.*

● **UNDERSTANDING AND PROGRAMMING MICROCOMPUTERS**—BK7382—A valuable addition to your computing library. This two-part text includes the best articles that have appeared in 73 and *Kilobaud Microcomputing* magazines on the hardware and software aspects of microcomputing. Well-known authors and well-structured text helps the reader get involved. \$10.95.*

HOW TO BUILD A MICROCOMPUTER—AND REALLY UNDERSTAND IT—by Sam Creason. The electronics hobbyist who wants to build his own microcomputer system now has a practical "How-To" guidebook. This book is a combination technical manual and programming guide that takes the hobbyist step-by-step through the design, construction, testing, and debugging of a complete microcomputer system. Must reading for anyone desiring a true understanding of small computer systems. \$9.95* BK7352

HOBBY COMPUTERS ARE HERE!!! you want to come up to speed on how computers work—hardware and software—this is an excellent book. It starts with fundamentals and explains the circuits and the basics of programming, along with a couple of TVT construction projects, ASCII, Baudot, etc. This book has the highest recommendations as a teaching aid. \$4.95* BK7322

*Use the order card in this magazine or itemize your order on a separate piece of paper and mail to: 73 Radio Bookshop, Peterborough NH 03458. Be sure to include check or detailed credit card information. No C.O.D. orders accepted. All orders add \$1.50 handling first book, \$1.00 each additional book, \$10.00 per book foreign airmail. Please allow 4-6 weeks for delivery. Questions regarding your order? Please write to Customer Service at the above address. (Prices subject to change on books not published by 73 Magazine.)

READER SERVICE

Please help us to bring you a better magazine—by answering these questions.

- A** 13's technical articles are
- 1 Too little
 - 2 Just right
 - 3 Too simple
- B** Which statement best describes the number of construction articles in each issue of 73?
- 1 Too many
 - 2 On the average, just the right amount
 - 3 Not enough
- C** Which of the following best describes your feelings about a typical homebrew article in 73?
- 1 Easy to understand and do
 - 2 Challenging but I could handle
 - 3 A bit tough, would like it
 - 4 I don't like construction articles

- D** What are your hobbies and leisure activities? Check all that apply
- 1 Amateur reading and writing
 - 2 Astrology
 - 3 Automobile collecting
 - 4 Aviation
 - 5 Boating
 - 6 Cards
 - 7 Collecting
 - 8 Community activities
 - 9 Computers
 - 10 Cooking
 - 11 Crafts
 - 12 Creative arts
 - 13 Electronic technology activities
 - 14 Games
 - 15 Gardening
 - 16 Model building
 - 17 Photography/hobby photography
 - 18 Sports & outdoor activities
 - 19 Travel
 - 20 Other

- E** What types of advertising (besides ham radio equipment) would you like to see in 73? Check all that apply
- 1 Computer hardware
 - 2 Computer software
 - 3 Business products
 - 4 Consumer products
 - 5 Electronics
 - 6 Hobby equipment
 - 7 Other

- F** How do you like 73's coverage of satellite TV?
- 1 Excellent coverage
 - 2 Some is OK, but you're gone too far
 - 3 Not much, something else
 - 4 Don't know
- G** If you could choose one mode of operating, what would it be?
- 1 Amateur FM
 - 2 Phone
 - 3 CW
 - 4 RTTY/SSB/other special modes

- H** Which one of the following activities do you enjoy the most?
- 1 Reading
 - 2 Operating hams
 - 3 Working up
 - 4 Building a homebrew project

- I** How do you like published reviews of new amateur gear?
- 1 Read them and find the information useful
 - 2 Read them but don't let them influence me
 - 3 Don't read them

- J** If you were an editor of 73 you would (check all that apply)
- 1 Publish more general technical articles
 - 2 Include more monthly columns
 - 3 Publish more construction articles
 - 4 Increase magazine circulation

- K** What is your primary source of information about amateur radio equipment? Check one only
- 1 Magazines
 - 2 Books
 - 3 Hamfests
 - 4 Stores
 - 5 Friends
 - 6 Other

CONTESTS

Robert Baker WB2GFE
15 Windsor Dr.
Atco NJ 08004

COUNTY HUNTERS

SSB CONTEST

Contest Periods:

0001 to 0800 GMT May 1
1200 GMT May 1 to 0800 May 2
1200 to 2400 GMT May 2

Please note the two 4-hour rest periods. Mobiles may be worked each time they change counties or bands. Mobiles that are worked again from the same country on a different band count for point credit only. Mobiles that are contacted on a county line count as one contact but 2 multipliers. Fixed stations may be worked by other fixed stations only once during the contest. Repeat QSOs between fixed stations on other bands are not permitted. Fixed stations may be worked by mo-

biles each time they change counties or bands. Repeat contacts between mobiles are permitted provided they are on a different band or county. Mixed-mode contacts are permitted provided that one station is on SSB. Contacts made on net frequencies will not be allowed for scoring in this year's contest.

EXCHANGE:

Signal report, county, and state or country.

FREQUENCIES:

Suggested frequencies are as follows: 3920-3940, 7220-7240, 14275-14295, 21375-21395, 28625-28650. There will be a "mobile window" of 10 kHz on the following frequencies: 3925-3935, 7225-7235, 14280-14290. Mobiles will be in this 10-kHz segment and fixed stations are asked to refrain from calling "CQ contest" in the mobile window. After working mobiles in the "window," fixed stations are requested to QSY outside the "window" to work fixed stations in the contest. This will allow the mobiles running lower power a chance to be heard and worked in the contest. There will be a special effort to work DX on 28.636 by mobiles.

SCORING:

Contact with a fixed US or Canadian station = 1 point; contact with a DX station (KL7 and KH6 count as DX) = 5 points; contact with a mobile station = 15 points. The multiplier is the total number of US counties plus Canadian stations worked. The final score is this multiplier times the total QSO points.

AWARDS:

MARAC plaques to the highest scoring fixed US or Canadian station, DX station, and top 2 scoring mobile stations. Certificates to the top 10 fixed and mobile stations in the US and Canada, and to the highest scoring station in each DX country.

ENTRIES:

Logs must show date and time, station worked, reports exchanged, county, state, band, claimed QSO points (1, 5, or 15), and each new multiplier must be numbered. Logs and summary sheets are free for a #10 SASE or SAE and appropriate IRCs. Write John Ferguson W0QWS, 3820 Stonewall Ct., Independence MO 64055. All entries must be received by June 15th to be eligible for awards. DX entries should use air mail. Winners will be announced at the 1982 Independent County Hunters Convention during July and in the MARAC newsletter.

SEVILLE

WORLDWIDE CONTEST

Starts: 1600 UTC May 1
Ends: 2000 UTC May 2

This contest is sponsored by the Seville (Spain) City Council and organized by the Seville Radio Club. Only single-operator entries are eligible. You may operate 24 hours of the 28-hour contest period, with 4 hours of rest taken in one or two periods. Contacts are allowed on SSB and CW, but a station may be worked only once per frequency band.

BANDS:

80 through 10 meters.

EXCHANGE:

RS(T) plus QSO number beginning with 001.

MULTIPLIER:

DXCC countries worked on each band.

POINTS:

Contacts between stations in

the same country count 2 points. Contacts between stations in different countries count 3 points. Exception: Contacts between EA, EA6, EA8 and EA9 count only 2 points.

SCORING:

Total QSO points times sum of multiplier points.

AWARDS:

Certificates will be awarded to the top-scoring station in each continent, each country, and each WIK, VE, JA, and EA call area. The Seville City Council will award an all-expense paid trip to Seville's April Fair Feast to the top-scoring EA and non-EA stations.

ENTRIES:

All times must be in UTC. Indicate multipliers in your log the first time they are worked on each band. Make a separate log and dupe sheet for each band. Include a summary sheet containing scoring information for each band, a station description, and a signed declaration that you have observed the contest rules and the regulations for amateur radio in your country. Please include your comments and photographs.

Entries must be postmarked no later than June 30th. Send entries to: Seville Worldwide Contest, Radio Club Sevilla, PO Box 555, Sevilla, Spain.

DISQUALIFICATION:

Violation of the contest rules, violation of amateur radio regulations, unsportsmanlike conduct, excessive duplicate contacts, or unverified QSOs will be deemed sufficient cause for disqualification. Decisions of the Contest Committee are final.

MICHIGAN QSO PARTY

Contest Periods:

1800 GMT Saturday, May 15 to
0300 GMT Sunday, May 16
1100 GMT Sunday, May 16 to
0200 GMT Monday, May 17

This year's QSO party will be sponsored by the Oak Park ARC. Phone and CW are combined into one contest. Michigan stations can work Michigan counties for multipliers. A station may be contacted once on each band/mode. Portable mobiles may be counted as new contacts each time they change counties.

EXCHANGE:

RS(T), QSO number, QTH as

 AUTOPATCH**

The First Affordable
 Private Phone Patch

As described in 73 Magazine, 6/81.

Now, for the first time! Every amateur operator can enjoy the unparalleled freedom of a private phone patch in an economical package.

The dramatic new CES 500SA Autopatch is all the equipment you need to patch an FM base station to your home or other telephone line, without expensive repeaters, cavities, or other equipment. Connections with any standard FM base station are rapid and simple.

Bypass the congestion and expense of shared repeaters — break through to greater privacy and convenience with the new CES 500SA Autopatch.

QSL OF THE MONTH: KX6SS

The colorful flag of the Marshall Islands provides an attractive design for the QSL of Keith R. Merrick KX6SS. Keith also holds call signs KG6SS and WA1GYS.

To enter our QSL of the Month Contest, put your card in an envelope and mail it, along with your choice of any book from 73's Radio Bookshop, to 73 Magazine, Pine Street, Peterborough NH 03458, Attention: QSL of the Month. Entries which are not sent in an envelope (the Postal Service does occasionally damage cards) and do not specify a book will not be considered.

state, country, or Michigan county.

FREQUENCIES:

Phone—1815, 3905, 7280, 14280, 21380, 28580.

CW—1810, 3540, 3725, 7035, 7125, 14035, 21035, 21125, 28035, 28125.

VHF—50.125, 145.025.

SCORING:

Multippliers are counted only once. Michigan stations score 1 point per phone QSO and multiply by the total number of states, countries, and Michigan counties. Each CW contact counts 2 points; KL7 and KH6 count as states; VE counts as

a country. Maximum multiplier is 85.

Others take QSO points times the total number of Michigan counties. QSO points are 1 point per phone QSO and 2 points per CW QSO. Maximum multiplier is 83.

All stations score 5 points for each club station contact with W8MB.

VHF-only entries: same as above except multipliers per VHF band are added together for total multiplier. Score 5 points for each OSCAR QSO. No repeater contacts are allowed.

AWARDS:

Michigan trophies to high Michigan score, high Michigan (Upper Peninsula) score, high aggregate club score. Plaque to high VHF-only entry and high mobile. Certificates to high score in each county with a minimum of 30 QSOs. Out-of-state high trophy and certificates for high score in each state and country. Added this year is a trophy for the highest scoring Michigan multi-operator score.

ENTRIES:

A summary sheet is requested showing the scoring and other pertinent information, name and address in block letters, and a signed declaration that all rules and regulations have been observed. Michigan stations include club name for combined club score. Party contacts do not count toward the Michigan Achievement Award unless one fact about Michigan is communicated. Members of the Michigan Week QSO Party Committee are not eligible for individual awards. Decisions of the Contest Committee are final. Results will be final on July 31st and will be mailed to all entries. Mailing deadline is June 30th to: Mark Shaw K8ED, 3810 Woodman, Troy MI 48084.

MICHIGAN ACHIEVEMENT AWARD

This will be the 24th year that hams have had their own program to publicize Michigan and its products. Just as for past years, the Governor will award Achievement Certificates to hams who take part in telling the world of Michigan's unlimited resources, opportunities, and advantages. Certificates are awarded on the following basis:

1. A Michigan ham submits

log information and names and addresses (if possible) of 15 or more contacts made to out-of-state or DX hams with information regarding Michigan.

2. An out-of-state ham, including Canada, submits log information and names and addresses (if possible) of at least five Michigan hams who relate facts to him about Michigan.

3. A foreign ham, excluding any resident of Canada, submits the call letters and name and address plus log information for at least one Michigan ham who has told him about Michigan.

Only QSOs made during Michigan Week, May 15-22, will be considered valid. All applications for certificates must be postmarked by July 1st and mailed to Governor William Milliken, Lansing MI 48902.

MT. SAINT HELENS QSO PARTY

Starts: 0001 GMT, May 22
Ends: 2359 GMT, May 23

The Clark County Amateur Radio Club, W7AIA, is pleased to announce the second annual QSO party marking the second anniversary of the cataclysmic explosion of nearby Mt. Saint Helens. This disastrous volcanic eruption took the life of Reid Blackburn KA7AMF, who was an active member of their club. Reid was monitoring a USGS observation station near the base of the mountain at the time of the eruption.

Any amateur station making one contact with W7AIA during the two days of the QSO party will be eligible to apply for the Mt. Saint Helens Award, a color certificate featuring a photograph of the awesome eruption of the volcano on May 18, 1980.

Look for W7AIA on the following frequencies (plus or minus QRM): SSB—3895, 7230, 14280, 21360, 28505; CW—3705, 7105, 21105, 28105; VHF—various Vancouver and Portland area repeaters.

To apply for the award, send log information or QSL card and \$2.00 (or 8 IRCs) to: Award Manager, W7AIA, PO Box 1424, Vancouver WA 98668. All proceeds from the award will go to the Reid Blackburn Scholarship Fund which has been established by the *Columbian*, a Vancouver newspaper. So far, 647 amateurs have applied for the award, which has provided for a \$1,000 contribution to the scholarship fund.

Kansas Amateur Radio

Public service in local and worldwide communications

NEWSLETTER OF THE MONTH

Amateur radio publications don't have to be either strictly local or strictly national in scope. This month's winner, *Kansas Amateur Radio*, is a good example of a regional publication.

Editor (and owner) KC0GL publishes *K.A.R.* quarterly in a magazine format. The January issue is printed on glossy stock and is 24 pages long. The layout is neat and the graphics are good; it's a professional-appearing publication. *Kansas Amateur Radio* covers what its name implies: the whole range of ham radio activities in Kansas, including net and club news, information about Kansas hams, and occasional technical articles.

This unique magazine is funded by reader contributions and a small amount of advertising revenue. It's a strictly non-profit operation that relies almost totally on reader support, both financial and editorial — as KC0GL puts it, "if you write it, we will print it!"

A lot of small clubs don't have enough going on to warrant a full newsletter each month. Support of a publication like *Kansas Amateur Radio* may be a more practical way for some clubs to get their news into print than undertaking the effort required to put out a good club newsletter. A group of clubs might even consider banding together to produce a cooperative newsletter. There's strength in numbers.

VoCOM AMPLIFIERS for 2m Hand-Helds

Amplifier features:

Up to 80% efficiency. 139-151 Mhz, 10 MHz b/w, tunable input & output, Bypass switch, LED indicator, relay switching, 11.5-15.5vdc. HV spike, rev. polarity & overdrive protection.

Model 2C025-2W 20-25w output when driven by a 1 1/2w hand-held, more than 30w with 2-5w drive. Model 2C025-200mW 25w output with 150-200mW drive. (HT in low-power mode). 2" x 3" x 4 1/4", 3-4 Amps.

Model 2C050-2W 50w or more output with 2-5w drive; 45-50w out with only 1 1/2w. 2 1/2" x 4 1/2" x 3", 7-9 Amps.

Model 2C100 100w output at rated input. Designed with plug-in drive modules. Match your rig! - select for 2, 10 or 25w. 2 1/2" x 4 1/2" x 6", 12-16 Amps.

POWER POCKET Mobile Amplifier/Charger. Just plug in your ICOM IC-2A(T) w/BP-3 battery pack and you have a 3/25 watt synthesized mobile rig - take in out again, all charged and ready, when you want hand-held operation. Built-in audio amplifier, speaker & mic, preamp. W/PTT mic. 13.8vdc/3.8 Amps. 2" x 3" x 4 1/4".

New Automatic Antenna Tuner Auto-Track AT 2500

Designed and Built by J. W. Miller Div.

Check these state-of-the-art specifications

- Power Capability: 2500 W PEP.
- Frequency Range: Continuous 3.0 to 30 MHz (including WARC Bands).
- Impedance Matching: 10 ohms to 300 ohms to 50 ohms resistive.
- Direct Reading SWR Meter: 1:1 to infinity.
- Direct Reading Power Meter: Two meter scales from 0 W to 250 W and 0 W to 2500 W; front panel switch selects FWD or Reflected Power (illuminated panel meters).
- Power meter displays RMS with continuous carrier and automatically displays PEAK when driven with SSB signal.
- Average "Automatic" tune-up time: 15 seconds or less.
- Tune-up time not affected by power level; can be as low as 1 W (5-10 W preferred).
- Power requirements are 115/230 VAC 50-60 Hz, 10 W operating/5 W standby; or 13.5 VDC, 1 A operating/.5A standby.
- Antenna tuner packaged in cabinet 17"W x 5 3/4"H x 14"D (Front panel handles or rack mount optional at extra cost).

REVIEW

ICOM'S IC-720A TRANSCEIVER

Although the four buildings at *73 Magazine* are each more than a mile apart, no telephone is needed when new equipment arrives for review. The 73 hams start forming lines the minute word gets around that equipment has arrived. Responding to that call, I was informed that the senior staff was so pleased with my previous reviews of dummy loads, power supplies, and BNC-to-garden-hose adaptors that they were going to give me a shot at a real radio.

Real radio is an understatement when it comes to Icom's newest all-mode, general-coverage transceiver, the 720A. This state-of-the-art solid-state rig should fill the bill for just about all devotees of the various modes of amateur communications available to us today on the HF bands. The first two days that the rig was available to me, it was put to use at W2NSD/1 where it was compared to several other transceivers in the station at the same time. In typical Icom fashion, the 720A's receiver outperformed all others — no mean feat when you consider that the Icom has a general-coverage receiver covering 100 kHz to 30 MHz.

The 720A arrived at my station the evening that the ARRL 10-meter contest started and I thought that I would attempt to put the rig through its paces during part of the contest. As it came from the box, 15 minutes prior to the start of the contest,

those familiar words "some assembly required" echoed in my mind. The separate power supply (IC-PS15) attached to the 720A with no problem. Two of the phono jacks, on the rear panel, serve dual functions. As it comes from the box, these jacks are set up to provide an input for a low-band antenna and transmitter/scope output. If you wish to use a linear amplifier, you must change the position of an internal connector, converting the function of these jacks to provide ALC and relay outputs. The conversion of these jacks required a few minutes study of the manual and less time in effecting the change.

With a few minutes left before the start of the contest, I thought I would take a look at the general-coverage frequencies. At that time of night, reception was good on the lower bands. I was surprised at the fidelity of the AM reception with only the standard filter in place.

My first encounter was with a Colombian station on 5 MHz playing traditional music. Having lived in Colombia for several years, it brought back memories and made me an instant SWL nut. Other treats in the first tour around the bands were an Austrian Christmas music special, a Spanish-language discussion of solar flux, a British Broadcasting Company London *Times* news program, a Portuguese discussion of the economic situation in the United States, and, of course, the old standby, Radio Moscow, with an editorial on

the United States' deployment of the neutron bomb in Europe. No tour would have been complete without a stop on the low end of 8 MHz where the CW maritime traffic, with its near-perfect code, is a great place to increase or maintain your code speed.

An interesting feature of the 720A was noted during this tour. While listening to one of the AM broadcasts, I noted that our old friend, the Russian woodpecker, was as prominent here as he is on the ham bands. Out of curiosity, I turned on the noise blanker and watched the interfering signal fall from 20 dB over S9 to S3. I still knew the offending signal was there, but it was much less bothersome.

Looking up at the clock, I found that the contest was already four hours old (later diagnosed as SWLer's disease). I decided to get a good night's rest and tackle the pileups in the morning. At first light I was on the bands. My first contact was W2NSD/1, 5-9 New Hampshire. Not bad, but I decided to use my limited time to hunt for countries. In eight hours, I racked up 47 countries and got a feel for how the 720A performed.

Operator's Manual

The first thing that impresses the new owner of a 720A is the clarity of the operator's manual. It begins with a concise walk-through of all controls and external connections (more than 50). It next provides detailed explanations of the major controls. A description of the circuit operation follows, remarkably understandable for a rig of this complexity. The section on maintenance and adjustments, along with photographs, covers most problems that might be encountered. While the schematic is small, a large-scale parts layout, in four colors, will prove invaluable for repairs.

My concern for the understandability of the owner's manual is sparked by the fact that I am a rural ham, living more than seventy miles from the nearest ham store and doing most repairs at home. With the 720A's manual, I would have no qualms about undertaking most repairs in the shack.

Icom Pioneers Again

The radio itself is small, measuring 4" x 9" x 12" and engineered to maximize the use of space. It appears to be most

functional when placed at eye level. With the 720A, Icom introduces a pioneering method of function and mode selection, similar to the system used by many pocket calculators. Push-buttons replace many of the knobs used by old-fashioned rigs. Several of the controls are dual-function. While first impressions yield the feeling that you will never understand all of the controls, a few hours of use will convince you of the functionality of this method as you quickly jump from band to band, change modes, and select filters with this new system.

The receiver, unquestionably the hottest I have ever used, utilizes low-noise FETs in the rf amplifier to aid sensitivity and double conversion, with high side injection and steep-skirted filters for maximum selectivity. The receiver covers 0.1 to 30 MHz in 1-MHz steps. A two-position button allows you to step through the covered frequencies, stopping at ham bands only or at any 1-MHz segment. The operating frequency is determined by a microprocessor-controlled PLL. One of the most interesting features of this radio is a low-pass-filter unit which employs a motor-driven rotary relay-switching circuit that selects various filter components for each band. During receive, the low-pass unit offers a high degree of adjacent channel rejection; during transmit, it removes harmonic components. The relay also delivers different control voltages to a plug on the rear panel for each band, thus allowing automatic band change for a linear amplifier and automatic antenna selection with external relays.

Operating Controls

The number of controls offered by the 720A provides maximum flexibility but makes description of the actual ease of operation difficult. In order that my written description does justice to the user-friendly 720A, the controls will be divided into four groups.

- Frequency selection. This group includes band-stepping switches, the switch to select one of the two vfo's available, main tuning knob, tuning-rate select buttons, and RIT button.
- Mode Selection. These include CW, SSB, AM, FM, RTTY, and a reverse-sideband select button.

Icom's IC-720A transceiver alongside the PS-15 12-volt power supply.

- Ancillary controls. These include the transmit/receive switch, af and rf gain controls, microphone and power output controls, noise blanker, pass-band tuning, and attenuator.
- Display. These include operating frequency, mode, sideband (u or l) and LEDs to indicate that certain functions or filters have been selected.

Operation

SSB and CW operation is straightforward. The frequency selection is made easy by the use of three tuning rates. Major changes can be made with the tuning speed button at a 1-kHz rate. The two other rates are 100 Hz and 10 Hz. The tuning knob is equipped with an adjustable brake that controls the friction on the knob. As it came from the factory, mine was too loose and had to be tightened. The rig is equipped with two vfo's and operation may be on either one or both (split), removing the need for an external vfo.

In this time of crowded band conditions, three features of the 720A make it an ideal operator's rig. The attenuator not only adds a 10-dB pad to the receiver front end, but also removes the rf amplifier. This reduces interfering signals and yields more stable reception. Pass-band tuning (PBT) accomplishes with one control what it takes other rigs two or three to do. PBT narrows the bandwidth (selectivity) of the frequencies that will pass through the crystal filter. This effectively reduces interference from nearby signals. The noise blanker, as I mentioned, is effective in reducing the interference from the woodpecker as well as the usual pulse-type trash such as ignition noise. Living out in the country where automobile traffic is about as common as QSL cards from BY-land, I parked my Subaru under a wire antenna and let it idle. If you are not familiar with this car, it is the noisiest (rf-wise) that you will run into. Letting it idle at 2000 rpm, I returned to the receiver and found the blanker to be effective.

The transmitter lived up to my expectations on SSB. With the obligatory "this is with the processor on" routine, I found that the processor had an above average or acceptable rating from the listeners. The VOX worked with no adjustment and it was

not necessary to go under the top access lid.

Speaking of "under the lid," in addition to the fifty some odd controls and jacks that the 720A has on the outside, a convenient top access lid houses additional controls. CW sidetone, meter-function select, and VOX control, that require seldom adjustment, are housed under this top lid.

CW operation is just as easy as SSB. The rig did not have the optional 500-Hz filter, but the 1.1-kHz filter provided proved to be adequate for casual use. Upon selecting the CW mode, an LED indicates the filter width and the PBT functions as it does on SSB, allowing the PB width to be narrowed by 800 Hz. Semi-break-in is possible using the VOX switch.

Other Modes

The 720A is equipped for FSK operation and narrow shift tones are available to be sent to a terminal unit. AM operation had to be tried since there is an abundance of 75-meter phone stations here in the Northeast. Reports of "broadcast quality" were heard more than once, giving me the interest to look into this mode further. During operation in this mode, the meter measures carrier power and the operator is cautioned that if he expects to operate for more than ten minutes, power should be reduced to the 70% level.

The finals are protected by a circuit that reduces power in an inverse ratio to swr. In addition, there is a cooling fan that is activated during the transmit mode by a thermal switch. The operator's manual cautions you that should the fan go to high speed, you should stop operating at once. I must admit that prior to operating this radio I was a "tube final" type and somewhat nervous about solid-state finals. As I spend most of my operating time on wire antennas, using a tuner, I approached my first 720A band change with trepidation. Relieved by the rapid response of the protection circuit, I adopted a more cavalier attitude with later changes. Since I spend a good part of my time chasing HK3DMD around the bands trying to link up for our regular sked, I can now appreciate the benefits of quick band changes offered by the 720A's solid-state finals.

In summary, the Icom 720A, in the hands of this operator, has

Top view of the 720A. The i-f module's cover has been removed, showing the location of the crystal filters.

proven to be a versatile and practical ham rig. In the course of two months' operation, no major problems were encountered. While not inexpensive, the unit's distinctive features gave me hours of enjoyment and broadened my perspective. The proof of the pudding is in the eating. Should you doubt my opinions, go to your nearest dealer and try the rig yourself. I guess the strongest case for ownership of the 720A is to ask if anyone wants to buy my old rig.

The Icom IC-720A and matching PS-15 power supply have a list price of \$1498. For more information, contact *Icom America*, 2112 116th Ave. NE, Bellevue WA 98004.

KB1T CONTEST CALENDAR

There was a time, not too many years ago, when calendars were plain and ordinary. Functional, yes, but not very exciting. All that's changed. The walls of our homes and offices are now covered with calendars

for cat haters and cat lovers, calendars from the Sierra Club and the oil companies, *Right to Life* and *Playboy Philosophy* calendars, even calendars devoted to pictures of polar bears (no kidding!). At long last, radio amateurs can join the calendar craze with one of their very own: the *Contest Calendar* from KB1T Radio Specialties.

The *Contest Calendar* is both functional and beautiful. On the functional side, it's a large, 18-x-18-inch, single sheet calendar, showing all 12 months at once. The center of the calendar features a great circle map of the Earth, centered on the USA, a handy aid to pointing your beam. Arrayed around the map are the individual calendars for the 12 months of the year. The weekends of major contests are highlighted in red with an abbreviated name of the contest and the mode (CW, phone). On the 1982 version, my count showed 28 contest weekends listed. The arrangement of the calendar on one sheet and the highlighting of the contest weekends make it easy to plan for upcoming oper-

ating activities—or anything else—at a glance.

And beautiful? The Contest Calendar is a work of art. The graphic design is bold, uncluttered and elegant. The entire calendar is printed on chromed mylar with the map in black. The 12 individual calendars have white backgrounds, with black numerals and red for the contest listings. It is the first and only ham shack accessory I have owned that non-amateurs seem to appreciate as much as fellow hams. It seems to draw more than its share of approving comments.

The Contest Calendar comes with four small adhesive tabs, allowing it to be mounted on a wall. I suspect many owners are framing theirs, however. Any active amateur, especially the contester, will appreciate the Contest Calendar. It's priced at \$4.50, from *KB1T Radio Specialties, Box 1015, Amherst NH 03031*. Reader Service number 493.

PACKET RADIO BOOK

The preface to *Packet Radio*, published by Tab Books, Inc., begins by asserting, "This book was written to provide an easy entry into the utterly fascinating world of packet radio." I'm not sure that any single volume could give an easy introduction to this highly complex subject, but this book comes pretty close. Actually, it is must reading for anyone even mildly interested in RTTY, networking, or computer communications in general.

There is a wealth of practical information here that authors Robert Rouleau and Ian Hodgson give merely as a background to the main subject. They offer, for example, a fairly lively review of the RS-232C interface, with lots of discussion of the vagaries of interfacing nonstandard equipment. I for one was thrilled to discover that there is a pair of inexpensive chips available which convert TTL-level signals to RS-232C and back again!

The chapter on resource sharing via multiplexing should be read by everyone. It's only a basic introduction to the subject, but it is fascinating to someone who has never consid-

The CES 635 Microdialer. (Photo by KA1LR)

ered the subject before (which is to say, most hams!).

The chapters covering packet itself are solid and meaty—I won't reveal the chapter titles because they might scare off the faint-hearted. They sound more formidable than they really are.

The material on high-speed data transmission via HF radio is must reading for any ham who dreams of 9600-baud QSOs. The problems of bandwidth, S/N ratio, path loss multipath, Rayleigh fading, propagation delay distortions, and woefully unsuitable transmitters and receivers are discussed in a matter-of-fact manner. If you dream of a quick and dirty improvement to our present RTTY system, a read through this section will be a sobering experience.

The bottom line, though, is that packet techniques are being used, today, and with reasonable success. To find out more, buy this book! For information, contact: *Tab Books, Inc., Blue Ridge Summit PA 17214*. Reader Service number 496.

be hung up carefully, to avoid pressing one of the buttons by accident. This is a small point, however, compared to some of the other problems the Microdialer solves.

Some owners of earlier autodialing microphones were quite chagrined to discover that their mikes occasionally suffered a glitch which locked their rig in the transmit mode. Hard luck if it happened when the rig was unattended! It was clearly injurious to the microphone, transceiver, and the blood pressure levels of others trying to use the frequency. CES cured the disease by removing the regulator chip (a source of heat) from the mike, putting in the radio instead, and tying the microprocessor's reset pin to the hangup hook. As long as the mike hanger on the vehicle's dashboard is grounded (and you use it!), there is no chance of an accidental transmission. Grounding the reset pin also lowers the mike's current drain from 120 mA off-hook to 60 mA on-hook. The dashboard in my car is plastic, so I simply ran a wire from a bolt in the firewall to one of the screws on the mike hanger. PL™ users should note that there is an extra conductor in the mike cable which can be used to enable a PL decoder when the mike is hung up and disable it when it is removed from its hanger. Nice touch!

Programmed to Please

The Microdialer really shines in the ease-of-use department. For example, when you dial a number in the automatic mode, the mike keys up the rig for .3 seconds before sending a tone—sort of a "look out equipment, here come some tones!" This feature alone allows me to use the Microdialer on several repeaters that won't accept my other dialer, which keys the PTT line at the same instant it sends the first tone.

Another welcome feature is the programmable pause. This allows you to program the autopatch access code (up to three digits) and a phone number into the same memory. The mike dials the access code, switches back to receive for two or three seconds so you can make sure that the dial tone is there, and then keys the transmitter and dials the number. If your repeater has some perverse speed requirements, you can program

THE CES MICRODIALER

For those who have never encountered an autodialing microphone before, it is a device designed to store several phone numbers and feed them into an FM transceiver at a predetermined speed at the press of a button. This is the basic function it must perform—but manufacturers and users alike soon discover that an autodialer must have several other features to perform adequately in the real world.

Like the Heathkit μ Matic memory keyer (to be reviewed in June), the CES Microdialer is a second generation microprocessor-controlled device designed to make life a little easier for the amateur radio operator. Also like the Heathkit, the Microdialer has solved many of the problems experienced with the generation of devices that preceded it.

One of the most striking improvements incorporated into the Microdialer is found in its layout. It makes sense to have the buttons and the mike element on the same side of the microphone. Several microphones have the touchtone™ buttons on one side and the mike element on the other. These must

the mike to send the access code at one speed and the phone number itself at another. And to make all this happen, all you have to do is push "*" and one of the numeric keys. The looks of envy you'll get from other hams when you set all this in motion are worth every penny you pay for the mike! If you are motivated by more practical considerations, consider that you can easily call home, the police, or whatever with the Microdialer, while your vehicle is in motion, without taking your eyes off the road for a second.

Entering numbers into memory is no easier or harder than with other autodialers we have tried. Memories 1 through 5 hold up to eleven digits, and 6 through 0 hold up to seven. Dialing speeds from one to eight digits per second can be programmed, and I am happy to report that there are several touchtone decoders in common use which can cope with the highest speed.

One repeater I use is plagued by a childish individual who frequently transmits tones while a user is trying to dial a number. With the Microdialer, I could bring up the patch and dial the number before our "friend" could find his or her mike.

Installing the Microdialer

If the Microdialer has any weakness, it lies in the simple fact that it involves some installation. Let's face it: There are a lot of guys who are too lazy to use a soldering iron. If a microphone doesn't come with the right plug for their rig attached, they aren't interested. To them I say, turn the page and read another article. Those of you who aren't afraid of a little work, read on!

The first thing you have to deal with is the regulator. CES solved a major problem by removing it from the mike case, but they created a minor one while doing it. You have to find a spot inside the rig for the tiny board which holds a 7805 regulator and a couple of filter caps. You also have to supply it with an unswitched source of 12 V dc. If you are using a rig over a year old, this doesn't present any problem, as there is usually lots of room for additions. I chose to use the Microdialer with my Kenwood TR-7730, one of the smallest rigs available. Getting the 12 V dc was easy—

finding a spot big enough for the regulator board was not. There is a nice opening at the rear of the rig that Kenwood suggests is good for a CTCSS encoder. It may be OK for the encoder, but the rf from the adjacent final amplifier added an unhealthy dose of hum to our audio when the regulator board was put there. I finally ended up removing the internal speaker, which I never used anyway. This yielded plenty of room for the microphone's regulator and a Communications Specialists programmable CTCSS encoder/decoder board. I stored the speaker and its mounting hardware in a safe place, in case I wanted to restore it to its original condition. If there's a will, there 's a way, and if it'll fit in a 7730, it'll fit anywhere!

In Use

I found the Microdialer an extremely helpful addition to my mobile VHF installation. Compared to the microphone supplied with the TR-7730, the microphone element itself has a wider frequency response, with a noticeable improvement in

lower midrange response. On the negative side of the ledger, it also has considerably less output, requiring the mike gain control inside the TR-7730 to be set much higher than previously required. This means that I cannot easily switch back and forth between the CES and Kenwood microphones.

I also found that the transmitter goes into the transmit mode for a brief moment when my sample is hung up on the grounded hanger. When I say brief, I really mean brief; it has never been long enough to bring up a repeater. I did not try the microphone with other radios, so I cannot say if this is only a problem with my particular installation or could be expected in others as well. In any case, it is not a serious problem, but you should be aware that it is there.

I am particularly fond of the microphone's shape and size. Many microphones must be held carefully, or your hand will cover the element, yielding muffled audio. You have to really work at it to make this happen with the Microdialer. It may be of little consequence to southern-

ers, but dwellers in the land of snow and ice will be happy to hear that the microphone cable is made of a material which stays flexible at a far lower temperature than other cables we have encountered.

Another point worth noting is that when used in the manual mode, the Microdialer behaves like a normal, run-of-the-mill touchtone pad. Certain other autodialers become rather churlish in the manual mode, beeping irritably and locking up for a second or two if you try to make it do something it thinks it shouldn't be doing. Rest assured that the Microdialer is too well-mannered to engage in such loutish behavior!

Conclusion

If you use an autopatch a lot, or frequently access your repeater's control functions, an autodialing microphone can un-complicate your life. The CES Microdialer incorporates some much-needed improvements over previous units and is priced at \$59.95 for a 500-Q model. The only feature that is missed is the ability to permanently store a series of numbers on a ROM chip. Maybe next year. . .

The Heath SA-2060 tuner features two meters. (Photo by N8RK)

Two variable capacitors and a roller inductor form a T-network in Heath's SA-2060 tuner. (Photo by N8RK)

HEATHKIT'S SA-2060 TUNER

It's easy to say that a tuner's a tuner, but if that's so why can you build one for next to nothing or spend over six hundred dollars for a motorized autotuning marvel? The answer boils down to power handling capability and convenience. Heathkit's model SA-2060 antenna tuner represents a good compromise between the extremes of tuner design. Selling for \$254.95, it's rated to handle the full legal power limit, contains a built-in wattmeter and antenna switch, and uses a roller inductor rather than the tapped coil used in many tuners, making it a lot easier to use than that coil-and-jumper-clips device you built as a Novice.

The SA-2060 uses the now standard T-network matching scheme and with its roller inductor can provide a match to some loads that tuners using tapped coils simply can't cope with. It

covers frequencies from 160 to 10 meters and can handle random wire or balanced feed antennas. A built-in 4:1 balun helps tame the wild impedances that

are sometimes found when using tuned feeders.

When this kit arrived, my first thought was that there couldn't be much involved in building an

antenna tuner, since at the minimum only two or three components are required. Well, when Heath tells you that you *build* this tuner, they mean it. It's up to you to assemble the two variable capacitors out of metal plates, ceramic insulators, and threaded rods. The roller inductor also needs assembly, although thankfully the coil itself is prewound.

Heath says that this kit is a three-evening project. That isn't far from the mark, although I spent considerably more time because of a modification I wanted to make (more on that later).

Although the instructions put the capacitor and coil assembly about halfway through the project, I'd suggest putting them together at the beginning so that all the little parts they use are out of your way. Assembly of the capacitors is for the most part very easy and great therapy after a hard day at work. Just keep slipping those little metal plates onto the assembly. It's a lot like threading popcorn onto a thread at Christmastime.

The rf sensing assembly for the wattmeter and the antenna switching circuitry are preassembled in a box which mounts on the back of the tuner chassis. Providing the critical wattmeter circuits already assembled and calibrated was a great move on the part of Heath. Not only did it speed up construction, but it's nice to be able to rely on their calibration (my tests show the SA-2060's meter to read within 5% of other meters used at W2NSD/1). The wattmeter actually uses two meters, one to show forward power on scales of 0-200 or 0-2000 Watts, and the second to read either reflected power (on scales of 0-50 or 0-500 Watts) or swr.

I found the reflected power mode to be easier to use than the swr mode when adjusting the tuner. All that's really necessary is to adjust for 0 Watts reflected power, so there's no need to know actual swr. Having dual meters is very convenient, since some tuning combinations can produce misleading reflected power or swr readings. By keeping an eye on both forward and reflected power, it's easy to spot these conditions and to tune for optimum settings.

The SA-2060 antenna switch provides three positions. One

routes the signal through the wattmeter but bypasses the tuner, while the other two select coax-fed antennas which go through both the meter and the tuner circuitry. There's no way, however, to switch the tuner in or out of line on a specific antenna—If you want to run the antenna through the tuner, you must do so all the time. This isn't really such a bad thing, since the tuner does act as a low-pass filter and helps prevent TVI, but it is inconvenient to have to adjust the tuner before using that antenna even if the swr in the part of the band being used is low enough such that the tuner isn't really needed.

There is a serious problem with this antenna-switching scheme if you want to use both coaxial and wire-fed antennas. The random wire/balanced feed terminals are connected to the tuner *before* the antenna switch, with the result that any antenna hooked up to these terminals is always in line and will be paralleled with a coax antenna selected by the antenna switch. This renders the switching system almost useless, since before switching to a coax antenna you have to go behind the tuner to disconnect the wire one. Fortunately, the fix for this problem is rather simple if you're willing to drill a hole in the chassis and change around some wiring (see box and photo).

With the antenna switching changed as described, the tuner is a joy to use. It handles a full kilowatt with ease (although the tuner should be adjusted before running at the power level—no tuner is designed to handle the voltages that may appear when feeding a kW into 15:1 swr!), and it survived the toughest test I can think of. While driving a vee beam with full power on 80 meters, the open feeder arced through a supporting board. The feeder was burned in two and the board caught fire, but the tuner survived this rather severe mismatch with no more than a brief arc between capacitor plates. Never let it be said that we baby equipment at W2NSD/1!

In more normal use at my home station, the SA-2060 has easily matched every so-called radiator I've connected to it, including a very badly mismatched vertical, a more-than-random random wire, and a coax-fed collinear dipole that

SWITCHING MODIFICATION FOR THE HEATH TUNER

The Heathkit SA-2060 antenna-switching problem described in the review is easily correctable.

The purpose of this modification is to disconnect random wire or balanced feed antenna terminals from the tuner circuit unless switch position COAX 2 is chosen.

As originally designed, the random/balanced antenna terminals were connected to the output of the tuner *before* the antenna switch. Thus, if an antenna was connected to either of these terminals, it would always be fed in parallel with any coaxial feed antenna chosen by the antenna switch. To avoid radiating on two antennas at once, it was necessary to disconnect the wire antenna from the back of the tuner when a coax antenna was used, and no antenna could be connected to the switch position selected when a wire antenna was to be used. This arrangement rendered the antenna switch useless to those who use both coax- and wire-fed antennas.

My solution was to move the connection point for the random/balanced terminals from the input of the coax switch to the COAX 2 output of the switch. Now, the wire antenna is connected to the tuner only when the COAX 2 position is selected, and a coax antenna can be used at COAX 1 without fear of feeding two antennas in parallel. The COAX 2 position can still be used to select a coax-fed antenna if no wire antenna is used.

The change involves mounting an additional ceramic feedthrough from the antenna switch box into the tuner chassis. This feedthrough is connected by a short strap to switch lug 6 inside the switch box. Lug 6 is also connected to the COAX 2 chassis connector.

The random antenna terminal is connected to the new feedthrough rather than to capacitor C2 as in the original design. No other internal connection is made to the random terminal. C2 is connected directly to the feedthrough from the switch box which was originally connected to the random terminal. The additional parts necessary can be ordered from Heath.

After studying the layout of the tuner, the whole process is easier to do than to describe. The only cautions are to drill the new hole with enough clearance to allow the feedthrough to miss the lip of the switch box (see photo for feedthrough location) and to make sure all the rf-carrying straps have as much separation from each other and from the chassis as possible.

An extra feedthrough insulator was added to increase the versatility of Heath's SA-2060 tuner. (Photo by N8RK)

presented a proper match at no given frequency. This tuner replaced another inexpensive commercial one, and I've found the change to be most refreshing. I no longer have problems with being able to almost, but not quite, get a perfect match, and the built-in metering and

switching (as modified) have eliminated the need for two other accessories, giving me a little more room on the operating table.

If you're in the market for an antenna tuner that includes some of the convenience features we've come to expect from

the high-priced supertuners but still carries a reasonable price tag, the Heathkit SA-2060 may be your answer. The only real flaw with the unit, the antenna switching, won't bother those who don't use wire feeders, and those who do can easily cure the problem. You'll have to invest

some of your time in building this tuner, but the results (and savings) can be gratifying.

HOBBY VIDEO

Offhand, I can think of only one occasion in my life when amateur radio and commercial video met. Since I need a justification for writing a column about hobby video in a ham magazine, let me tell you about it.

It happened on the day I took my Extra test (the time I passed). I had just left the Federal Building on New York's Varick Street with my interim permit clutched firmly in my fist. As I was making my way over to Washington Square to catch the subway back home, I suddenly noticed in front of me a bunch of klieg lights, cameras, and a typical Greenwich Village street with cars and street signs of an early-1960s vintage.

"Could you hold it a minute, fella?" a man in a light-colored windbreaker asked me.

"Sure," said I. "Hey, what's going on here?" I inquired, asking the obvious, as usual.

The guy in the windbreaker paused for a second, looked me over very closely, and said: "It's okay. Go on ahead. Your clothes fit into the period, anyway." So, with that I slipped between two wooden barriers and continued my eastward march.

I'm about halfway along the block when a taxi comes tearing down the street with a 1959 Chevy sedan in hot pursuit. The cab smashes into a fire hydrant directly across from me and two rough types jump out of the car and put the collar on the taxi driver. It was, of course, a part of a movie—a TV movie, as it turned out. And the Panavision camera caught me as a horrified onlooker. I later saw the movie on ABC, but I guess my scene landed on the editing room floor—I wasn't in the completed film.

So, that was the day broadcast television and ham radio made almost simultaneous appearances in my life. Listen, it may not be the greatest story ever told, but at least it gave me a lead to this month's column.

On a wildly different note, I know someone who is writing a high-school electronics textbook. As a plug for ham radio to a potentially ripe audience, this chap thought he would include some information about the OSCAR satellites in his book. My friend wrote to the ARRL asking for a couple of black and white photographs so that his readers could get an idea of what an amateur-built satellite looks like.

The upshot of his efforts, sad to say, was a letter from HQ saying that the League's OSCAR photos are for use only in their own publications and "are not for dissemination to the general public." Wonderful. So the League doesn't want the general public to know what the OSCAR satellites look like. It's a great boost to our hobby when only hams can find out about OSCAR.

All in all, another tidbit of information to remember the next time a League official lets loose some of that babble about your dues going toward more than just a magazine subscription. Phooey!

THE ANSWERS

- Element 1:
See Illustration 1A.
- Element 2:
1—2 There's no Doody in Newington.
2—3 But his agent is.
3—4 Remember? They had those little HTs that never seemed

to be limited in range or vulnerable to jammers.
 4—3 Roy Neal works for NBC, Murray Greshner is the cop on *The Odd Couple* and I don't know who the heck Hector Fuentes is.
 5—4 Satcom III (not to be confused with its replacement, Satcom IIIR) was lost shortly after launch. Nobody knows for sure where Satcom III is, but I understand they're watching some great movies up on Pluto.

Element 3:

- 1—True *The Killers*, in 1963. It was his last acting job—on screen, anyway.
- 2—False Time-Life.
- 3—True And make that a double, please.
- 4—True It didn't work.
- 5—True Operated by NBC in New York.
- 6—False There is a Channel One, but we call it "6 meters."
- 7—True The FCC thought RCA's all-electronic system was somewhat better.
- 8—True Smile.
- 9)—False Paul Nipkow was granted a German patent for such an instrument in 1884!
- 10—True And I've got a recording of the program to prove it!

Element 4:

See Illustration 2A.

SCORING

Element 1:

Twenty-five points for the completed puzzle, or 1/2 point for each question correctly answered.

Element 2:

Five points for each correct answer.

Element 3:

Two and one-half points for each correct answer.

Element 4:

Twenty-five points for the completed puzzle, or one point for each correct answer.

So, do you know the difference between a plate and a dish?

- 1-20 points—Sees only snow
- 21-40 points—Dish pointed at Earth
- 41-60 points—Fuzzy picture
- 61-80 points—Sharp black and white picture
- 81-100 + points—Closed-circuit image

READER'S CORNER

Last January's puzzle concerning the five stations and their DX schedules provoked a sizable flurry of mail — some of it indignant. As a few of you discovered, there were actually *three* solutions to this puzzle. Here they are:

Reprinted from the Federal Register

Expansion of the Telephony Segments of the High Frequency Amateur Radio Service Bands

AGENCY: Federal Communications Commission.

ACTION: Notice of inquiry and proposed rule.

SUMMARY: The Commission proposes to make additional segments of the 14 MHz amateur band available for telephony operation. The Commission is also inquiring about making additional segments available for telephony

operation in the other high frequency (HF) amateur bands (those amateur bands between 3 and 30 MHz). Congestion on the frequencies currently authorized for telephony use is causing the employment of this mode to become increasingly difficult. The proposed rules revision would help alleviate this situation in the 14 MHz band. The inquiry looks towards finding a suitable set of frequencies for telephony expansion in the other HF amateur bands.

DATES: File comments on or before July 1, 1982, and reply comments on or before

SUPPLEMENTARY INFORMATION:

Adopted: February 11, 1982.

Released: February 24, 1982.

Introduction

1. Notice of Inquiry and Proposed Rule Making in the above-entitled matter is hereby given.

2. The Commission has before it at this time seven petitions for rule making which request that the Amateur Radio Service Rules (Part 97) be amended by provide for the use of telephony operation (emission types A3 and F3) on additional portions of the amateur high frequency (HF) bands—the bands between 3 and 30 MHz. Six of the petitions propose some particular portion of certain bands for additional telephony authorization. Four of the petitions propose that additional

telephony privileges be divided among or limited to certain operator classes. The petitions are described in the following paragraphs.

3. RM-3705, submitted by Philip Galasso and received by the Commission on 16, 1980, requests that the frequencies 3750-3775 kHz, 7050-7100 kHz, 14100-14200 kHz, 21200-21250 kHz and 28200-28500 kHz be added to those authorized for telephony in the United States. It further requests that these additional telephony privileges only be granted to Amateur Extra Class operators and that power input during such operation be limited to 250 watts. The petition claims that expansion of frequencies for telephony operation is warranted due to congestion on the currently authorized telephony

subbands and under-utilization by U.S. stations of the frequencies proposed for expansion. Lack of use by U.S. amateurs is attributed to incompatibility between telegraphy operation currently authorized for U.S. stations and telephony operation in common use by

foreign stations. Operator class and power restrictions are requested by the petition to help "... assure minimum interference to the existing radiotelephone users of these frequencies. . . ."

4. RM-3729, submitted by David Novoa and received by the Commission on June 30, 1980, requests that the frequencies 7075-7100 kHz and 14175-14200 kHz be allocated for exclusive use by Amateur Extra Class licensees and that telephony operation be authorized on these frequencies. This petition also cites crowding on existing telephony subbands and incompatibility of domestic telephony operations with foreign telephony operations as reasons for expanding the telephony subbands. The petition further claims that protection for foreign amateurs from powerful U.S. stations is no longer necessary and that foreign stations, in fact, favor a subband expansion which would enable them to engage in an exchange of telephony communications with U.S. stations on a single frequency.

5. RM-3734, submitted by James Simon and William Bennett and received by the Commission on August 1, 1980, requests that the frequencies 3750-3775 kHz, 7050-7150 kHz, 14100-14200 kHz, 21200-21250 kHz and 28400-28500 kHz be made available for telephony use by U.S. amateurs. This petition again cites overcrowding on currently authorized telephony subbands and lack of further need for protection of foreign stations as reasons for its request.

8. RM-3778, submitted by the Willamette Valley DX Club by Robert Herndon and received by the Commission on October 7, 1980, requests that the frequencies 3750-3775 kHz, 7050-7100 kHz, 14100-14200 kHz, 21200-21250 kHz and 28400-28500 kHz be authorized for telephony operation since, it contends, "the United States no longer has the dominant amateur population and there is little reason to think that the expansion of U.S. amateur (telephony) privileges into previously reserved frequencies will result in undue hardship on foreign amateurs." The expansion is necessary, it claims, to relieve congestion on currently authorized telephony subbands.

7. RM-3831, submitted by Ronald Kramer and received by the Commission on November 7, 1980, petitions the Commission to increase the portion of each amateur frequency band between 1.8 and 30 MHz available for voice (telephony) communication and correspondingly decrease the portion of each band available for telegraphy communications. The petition claims this is necessary since the telephony mode is becoming increasingly popular.

8. RM-3833, submitted by Fred Huntley and received by the Commission on January 13, 1981, requests that "Extra Class Amateur Radio licensees be granted radiotelephone operation privileges between 7.100 and 7.150 MHz" and that "(s)uch operation be authorized a maximum power input of 250 watts." The petition proposes that this additional operation be on a shared basis with existing Novice class operations. Relief of congestion and interference on the existing telephony segment of that band is cited as necessitating this action.

9. RM-3860, submitted by the American Radio Relay League (ARRL) and received by the Commission on March 9, 1981, requests that the frequencies 14150-14200 kHz be added to those authorized for telephony use and that operator privileges on the revised telephony portions of the 14 MHz band be changed to the following: 14150-14175 kHz, Amateur Extra Class only; 14175-14225 kHz, Amateur Extra and Advanced Classes; 14225-14350 kHz, Amateur Extra, Advanced and General Classes. The petition cites growing congestion in the present telephony subbands as warranting

expansion of the subbands. The operator privilege changes are proposed by the petition in the interest of lessening the impact of telephony subband expansion on foreign amateur operations.

Background

10. The Commission has traditionally designated particular portions of the heavily used HF amateur frequency bands for operation using certain emission modes, while only permitting other modes on different portions of the bands. These designations have served to segregate incompatible operating modes. Since the early days of radio, simultaneous use of incompatible modes on the same frequencies has worked to the mutual detriment of communications using all modes. Placing certain emission modes on different frequencies avoids this type of interference and has the further beneficial effect of indicating to amateur operators where, in the amateur bands, to seek out certain forms of operation.

11. The subband allocations¹ have also been arranged to protect international amateur radio operations. Foreign operators have consistently, in the past, objected to expansion of U.S. subbands for increasingly popular, wide bandwidth emissions such as telephony.² They have claimed that such an expansion would create a situation where high powered U.S. stations would overrun low power foreign stations and effectively prohibit the foreign stations from using those bands.

12. Protection of foreign stations has also benefited U.S. operators desiring to contact them using telephony. The U.S. operator can listen for the foreign stations in a portion of the band where strong U.S. signals are not present³ and then reply on frequencies within the U.S. telephony subbands. The foreign operators then listen for the U.S. stations in the U.S. telephony subbands.⁴

13. Current regulations permit emission type A1 Morse telegraphy operation on all amateur radio frequencies. This unique universal authorization for that mode results from its character as an efficient and widely recognized communications language that can be employed with the simplest type of equipment. In the amateur 160 meter band (1800-2000 kHz) type A3 telephony operation is currently permitted on all frequencies. In all HF amateur bands roughly half of the band may be used for A3 or F3 telephony emissions. The limitations on telephony operation in most of the HF bands were instituted in order to prevent such operation from overwhelming telegraphy operations as well as to protect international operations. Type F1 digitally coded emissions (radioteletype) are permitted in all portions of the HF bands where telephony operation is not permitted since this type of operation is more harmonious with type A1 operation. The only other modes permitted on the HF bands, emission types A5 and F5 "slow-scan" television operation and emission types A4 and F4 facsimile operation, require a bandwidth approximately equivalent to telephony operation and consequently are

permitted in the telephony subbands.⁵ This current state of subband allocation in the HF amateur bands is the result of the Report and Order in the last proceeding dealing with expansion of the telephony subbands.⁶

14. Small portions of the various subband allocations are reserved for Amateur Extra Class and Advanced Class licensees. These portions were set aside to help provide an incentive for amateurs to upgrade their license operator class. This program of reserved operator privileges resulted from the proceeding dealing with incentive licensing and distinctive call signs.⁷

Proposal

15. The Commission proposes to expand telephony privileges in the 14 MHz amateur band by adding the frequencies 14150-14200 kHz to those currently authorized for such use. We feel this action is warranted due to the extreme congestion experienced by amateurs on the existing 14200-14350 kHz telephony subband. Although the various petitions' requests ranged from a subband that would start as low as 14100 kHz and extend to 14350 kHz, to a subband that would start as high as 14175 kHz and extend to 14350 kHz, we have selected a starting point of 14150 kHz to propose as a compromise between competing objectives. We anticipate that our proposal would provide substantial relief to the current overcrowding in the 14 MHz telephony subband while causing only a minimal disturbance to international operations. The increasing sophistication of equipment used by both foreign and domestic amateur operators leads us to believe that foreign stations should not experience undue interference from U.S. operations and that U.S. amateurs attempting to contact foreign stations should have less difficulty using single frequency operation (as opposed to "split operation") than they have had in the past. We propose retaining the frequencies 14100-14150 kHz for traditional weak signal and other international operations by not changing the modes authorized on those frequencies.

16. Since we do not anticipate a significant detrimental impact on international operations from our proposal, and since we desire to provide the maximum relief possible from the current overcrowding, we propose to make all of the additional telephony subband frequencies available to Amateur Extra Class, Advanced Class and General Class operators. To this end, we have specifically proposed to not change any of the operator privileges. However, we invite comments as to whether it would be desirable to delete from General Class operators the privileges between 14150 kHz and 14200 kHz, and instead, add privileges between 14225 kHz and 14275 kHz to those authorized for General Class operators. In this way, the telephony subbands available to General Class operators will be contiguous. Also, consistent with our action in PR Docket 80-252 to permit the use of television and facsimile on most portions of the HF bands where telephony is permitted, we propose to include the use of type A4, A5, F4 and F5 emissions in the new 14150-14200 kHz subband allocation. We are not proposing a stricter power limitation for the additional subband allocation since we do not feel this would make any significant contribution toward avoiding interference.

Inquiry

¹ Authorization of emission types A5 and F5 "slow-scan" television operation, along with types A4 and F4 facsimile operation, in entire HF telephony subbands was the subject of the proceeding in PR Docket 80-252. See Report and Order, 47 FR 2872, January 20, 1982.

² Report and Order in Docket 19182, 37 FR 21325, October 7, 1972.

³ Report and Order in Docket 15928, 32 FR 12882, September 1, 1967.

17. The 14 MHz amateur band has one of the two smallest telephony subband allocations and is, perhaps, the most popular HF amateur band due to its reliability for long distance communications. Because of these factors, we believe that crowding on this band is severe enough to transcend much of the controversy surrounding telephony subband expansion, and for this reason we have set forth a specific proposal for that band. However, we are not proposing expansion of any of the other telephony subbands between 3.5 and 29.7 MHz because we feel the issues involved are too inadequately defined for us to commit ourselves to any particular course of action. Instead, we invite the submission of comments and supporting information with which these issues may be clarified. The Commission recognizes that the existing telephony subbands are often seriously overcrowded. However, we request commenters to weigh the magnitude of this problem against the issues addressed in the following questions:

A. Would expansion of the telephony subbands have a major detrimental impact on domestic telegraphy operations?

B. Do non-U.S. stations still have a legitimate requirement to be protected, on some frequencies, from U.S. telephony operations?

C. Does the current trend toward the use of transceivers (with a common transmit and receive tuner) make the reservation of frequencies suitable for contacting foreign stations using "split operation" unnecessary or undesirable?

D. Should additional subband allocations for telephony be contiguous with the existing telephony subbands?

E. Would it be appropriate to relocate the existing Novice subbands to new frequencies within the same HF bands in order to make a telephony subband expansion more orderly?

F. Are the current exclusive subbands for Amateur Extra and Advanced Class operators sufficient to meet the goals of our incentive licensing program if all additional telephony frequencies are authorized to General as well as Amateur Extra and Advanced Class operators?

G. How should the recent expansion of the Canadian telephony subband in the 7 MHz band influence proposals for a U.S. telephony expansion in the same band?

18. We also encourage commenters to make specific recommendations as to what frequencies would be best suited to use for additional telephony privileges and the relative occupancy of those frequencies. Comments about related matters not explicitly mentioned above are also invited.

Conclusion

19. Notice is hereby given that it is proposed to amend 47 CFR Part 97 in accordance with the proposals set forth in the attached Appendix. Notice is also given of inquiry into the matter discussed above.

Procedural Matters

20. For purposes of this non-restricted notice and comment rule making proceeding, members of the public are advised that *ex parte* contracts are permitted from the time the Commission adopts a notice of proposed rule making until the time a public notice is issued stating that a substantive disposition of the matter is to be considered at a forthcoming meeting or until a final order disposing of the matter is adopted by the Commission, whichever is earlier. In general, an *ex parte* presentation is any written or oral communication (other than formal written comments/pleadings and formal oral arguments) between a person outside the Commission and a Commissioner or a member of the Commission's staff which addresses the merits of the proceeding. Any person who submits a written *ex parte* presentation must serve a copy of that presentation on the Commission's

¹ The term "subband" is popularly used to describe a segment of a frequency band where authorized modes of emission or authorized operator class privileges are different from those in other portions of the same band. This term is used throughout the text for the sake of clarity.

² Depending on the specific emission mode employed, telephony operations in the HF amateur bands occupy a bandwidth roughly between 3 kHz and 7 kHz. The more popular telephony modes in use today (principally A3 single sideband) occupy somewhat less than 4 kHz. On the other hand, telegraphy emissions used in the HF bands (both A1 and F1 types) occupy less than 1 kHz.

³ This portion of a band, where domestic telephony operation is not permitted and where operators listen for foreign stations to contact, is commonly known as the "DX widow."

⁴ This form of operation where an amateur transmits to a station on one frequency and listens for the station's reply on another frequency is commonly known as "split frequency operation."

Secretary for inclusion in the public file. Any person who makes an oral *ex parte* presentation addressing matters not fully covered in any previously-filed written comments for the proceeding must prepare a written summary of that presentation; on the day of oral presentation, that written summary must be served on the Commission's Secretary for inclusion in the public file, with a copy to the Commission official receiving the oral presentation. Each *ex parte* presentation described above must state on its face that the Secretary has been served, and must also state by docket number the proceeding to which it relates. See generally, Section 1.1231 of the Commission's rules, 47 CFR 1.1231. A summary of the Commission's procedures governing *ex parte* contacts in informal rule makings is available from the Commission's Consumer Assistance Office, FCC, Washington, DC 20554, (202) 632-7000.

21. Authority for issuance of this Notice is contained in Sections 4(i), 303(r) and 403 of the Communications Act of 1934, as amended, 47 U.S.C.

154(i), 303(r) and 403. Pursuant to applicable procedures set forth in Section 1.415 of the Commission's Rules, interested persons may file comments on or before July 1, 1982, and reply comments on or before August 2, 1982. All relevant and timely comments will be considered by the Commission before final action is taken in this proceeding. In reaching its decision, the Commission may take into consideration information and ideas not contained in the comments, provided that such information or a writing indicating the nature and source of such information, is placed in the public file, and provided that the fact of the Commission's reliance on such information is noted in the Report and Order.

22. In accordance with § 1.419 of the Commission's rules, 47 CFR 1.419, formal participants must file an original and five copies of their comments and other materials. Participants who wish each Commissioner to have a personal copy of their comments should file an original and eleven copies. Members of the general public who wish to express their

interest by participating informally may do so by submitting one copy. All comments are given the same consideration, regardless of the number of copies submitted. All documents will be available for public inspection during regular business hours in the Commission's Public Reference Room at its headquarters in Washington, DC.

23. The Commission has determined that Sections 803 and 804 of the Regulatory Flexibility Act of 1980 (Pub. L. 96-354) do not apply to this rule making proceeding since the proposed rules would only change operating practice. These changes would not compel amateur operators to purchase new equipment and consequently would have no significant economic impact on them or any small businesses, small organizations or small governmental jurisdictions.

24. It is ordered that the Secretary shall cause a copy of this Notice to be served upon the Chief Counsel for Advocacy of the Small Business Administration and that the Secretary shall also cause a copy of this Notice to

be published in the Federal Register.

25. For further information on this proceeding contact Steve Lett, Federal Communications Commission, Private Radio Bureau, Washington, DC 20554, (202) 632-7597.

(Secs. 4, 303, 307, 48 Stat., as amended, 1066, 1082, 1083; 47 U.S.C. 154, 303, 307)

Federal Communications Commission.

William J. Tricarico,

Secretary.

Appendix

PART 97—AMATEUR RADIO SERVICE

It is proposed that paragraph (a) of § 97.81 of the Commission's Rules and Regulations, 47 CFR 97.81, be amended as follows:

In the table in that paragraph, the row beginning with "14200-14350 (kHz)" would be revised by beginning the row with "14150-14350 (kHz)" so that the entire row reads as follows:

14150-14350 A3, A4, A5, F3, F4, F5
 § 97.81 (Amended)

include door prizes every hour, indoor vendors, a flea market, and nets and group meetings. Food and drink will be available. Talk-in on 146.19/79 and 147.86/26. For further information, write Jack R. Thompson KA4RKS, 637 Wolf Road, Covington KY 41015, or call (606)-291-2153.

MUNCIE IN MAY 23

The 3rd annual Muncie Area Amateur Radio Club Hamfest will be held on May 23, 1982, from 8:00 am to 3:00 pm at the Ball State University indoor track building, Muncie IN. Tickets are \$2.00 in advance or \$3.00 at the door. All activities are under a roof and there will be forums, prizes, refreshments, and parking available. Flea market tables are \$4.00 on a first-come basis, and setup will be 6:00 pm to 1:00 am on Saturday and 6:00 am to 7:45 am on Sunday. Talk-in on 146.13/73, 146.52, and 223.10/24.70. For further information, contact Terry

Evans WD9HQH, 522 S. Brother-ton, Muncie IN 47302, or phone (317)-282-0615.

FREETOWN MA MAY 23

The Fall River Amateur Radio Club will hold its flea market on Sunday, May 23, 1982, from 10:00 am to 4:00 pm at the American Legion Hall, Freetown MA. Admission is \$1.00 and flea market spaces are \$7.00 in advance or \$9.00 at the door (the table price includes 2 admissions). Free coffee will be available. Talk-in on 147.63/03 and .52. For space reservations, send a check payable to Fall River Amateur Radio Club to Ann M. Carro KA1DNB, 652 Old Colony Terrace, Tiverton RI 02878.

GEORGETOWN IL MAY 23

The 13th annual Danville Area Hamfest will be held on May 23, 1982, at the fairgrounds in Georgetown IL. The gates will open at 6:00 am. Adult tickets are \$2.50 in advance and \$3.00 at the gate; children under 14 years

of age will be admitted free. There will be a free outdoor flea market area (please bring your own tables, chairs, and power cords). The indoor area will be available at additional cost. Overnight camping, with or without water and electrical hook-ups, is \$5.00 per vehicle per night. Activities will include door prize drawings, family entertainment, forums, and much more. Refreshments, free coffee, and free parking will be available. Talk-in on 146.22/82 and 146.52. For more information on tickets and/or tables, contact Wendell Lyons KA9AYS, Hamfest Chairman, 903 Polk Street, Danville IL 61832 or phone (217)-431-2124.

PITTSBURGH PA MAY 23

The 28th annual Breeze Shooters Hamfest will be held on May 23, 1982, from noon to 5:00 pm at the White Swan Park, Rte. 60 (Parkway West), near the Greater Pittsburgh International Airport, Pittsburgh PA. Registration is \$2.00 or three for \$5.00. Activities are a free flea market, prizes, a CW contest, and a family amusement park. Sheltered tables for vendors are available by advance registration only. Talk-in on 146.28/88 or 29.0. For further information, contact Joe Kyler K3SJD, 4430 Evergreen

Road, Pittsburgh PA 15214, or phone (412)-931-2756.

PARAMUS NJ MAY 23

The Bergen Amateur Radio Association will hold a Swap 'n Sell on May 23, 1982, from 8:00 am to 4:00 pm at Bergen Community College, 400 Paramus Road, Paramus NJ. Buyers will be admitted free. There will be tailgating only and spaces are \$3.00 (bring your own tables). For more information, contact Jim Greer KK2U, 444 Berkshire Road, Ridgewood NJ 07450, or phone (201)-445-2855.

FREMONT OH MAY 23

The Ohio Radio Club and the Ottawa County Amateur Radio Club will hold a hamfest on May 23, 1982, at the fairgrounds in Fremont OH. Dealers may set up at 7:00 am and gates will open at 8:00 am. Advance tickets are \$2.50 and \$3.00 at the door. Talk-in on .31/91 and .52. For table reservations and tickets, send an SASE to John Dickey W8CDR, 545 N. Jackson Street, Fremont OH 43420.

WEST FRIENDSHIP MD MAY 30

The Maryland FM Association will hold its annual hamfest on Sunday, May 30, 1982, from 8:00 am to 4:00 pm at the Howard County Fairgrounds, West Friendship MD (about 30 miles west of Baltimore). Admission is a \$3.00 donation, tailgating is \$3.00, advance reserved tables are \$6.00 each, and tables at the hamfest will be \$10.00. Talk-in on 146.16/76 and .52. For more information, write MFMA Hamfest Committee, Post Office, Harmans MD 21077. For table information and reservations, contact John Elgin WA3MNN, 5495 Apt. 2, Harpers Farm Road, Columbia MD 21044, or phone (301)-596-3741.

Listings in this column are provided free of charge on a space-available basis. The following information should be included in every announcement: sponsor, event, date, time, place, city, state, admission charge (if any), features, talk-in frequencies, and the name of whom to contact for further information. Announcements must be received two months prior to the month in which the event takes place.

NEW
ARRIVALS

Annotated BASIC—A New Technique for Neophytes.

BASIC programming was supposed to be simple—a beginner's programming language which was so near to English that it could be easily understood. But, in recent years, BASIC has become much more powerful and therefore much more difficult to read and understand. BASIC simply isn't basic anymore.

Annotated BASIC explains the complexities of modern BASIC. It includes complete TRS-80* Level II BASIC programs that you can use. Each program is annotated to explain in step-by-step fashion the workings of the program. Programs are flowcharted to assist you in following the operational sequence. And—each chapter includes a description of the new concepts which have been introduced.

Annotated BASIC deals with the hows and whys of TRS-80 BASIC programming. How is a program put together? Why is it written that way? By observing the programs and following the annotation, you can develop new techniques to use in your own programs—or modify commercial programs for your specific use.

Annotated BASIC Volume 1 contains Projecting Profits, Surveyor, Things to Do, Tax Shelter, Introduction to Digital Logic, Camelot, The Soundex Code, Deduction, Op Amp, Contractor Cost Estimating. BK7384 \$10.95 ISBN 0-88006-028-X

Annotated BASIC Volume 2 contains Rough Lumber List, Trip Mileage, Flight Plan, OSCAR Data, SWR/Antenna Design, Supermaze, Petals Around the Rose, Numeric Analysis, Demons, Air Raid, Geography Test, Plumbing System Design. BK7385 \$10.95 ISBN 0-88006-037-9

Order Both Volumes and Save! BK738402 \$18.95

Kilobaud Classroom—

A practical course in digital electronics

by George Young and Peter Stark

Learning electronics theory without practice isn't easy. And it's no fun to build an electronics project that you can't use. *Kilobaud Classroom*, the popular series first published in *Kilobaud Microcomputing*, combines theory with practice. This is a *practical* course in digital electronics. It starts out with very simple electronics projects, and by the end of the course, you'll construct your own working microcomputer!

Authors Young and Stark are experienced teachers, and their approach is simple and direct. Whether you're learning at home or in the classroom, this book provides you with a solid background in electronics—and you'll own a computer that you built yourself!

Kilobaud Classroom contains Getting the Ball Rolling, Gates and Flip Flops Explained, J-K Flip Flops and Clocked Logic, PC Boards and Power Supplies, Hardware Logical Functions, Voltage, Current and Power Supplies, Transistors, Diodes and OP Amps, Pulses and More Pulses, Counters and Registers, Bus Traffic Control, ROM and RAM Memories, I/O Circuitry, Parallel and Serial I/O Ports, Computer I/O III, Computer I/O IV, Computer I/O V, Processor Connections, Finally—The Kilobaud Crescendo: Eproms and Troubleshooting, Expansions and Programming, Machine-Language Programming, Assembly Language Programming, Connecting to the Outside World.

ISBN 0-88006-027-1 **BK7386 \$14.95**

The New Weather Satellite Handbook

By Dr. Ralph E. Taggart WB8DQT

Here is the completely updated and revised edition of the best-selling *Weather Satellite Handbook*—containing all the information on the most sophisticated spacecraft now in orbit. Dr. Taggart has written this book to serve both the experienced amateur satellite enthusiast and the newcomer. The book is an introduction to satellite watching that tells you how to construct a complete and highly effective ground station. Not just ideas, but solid hardware designs and all the instructions necessary to operate the equipment are included. An entire chapter is devoted to microcomputers and the Weather Satellite Station. And for the thousands of experimenters who are operating stations, *The New Weather Satellite Handbook* details all the procedures necessary to follow the current spacecraft.

Weather Satellite contains Operational Satellite Systems, Antenna Systems, Weather Satellite Receivers, A Cathode Ray Tube (CRT) Monitor for Satellite Picture Display, A Direct Printing Facsimile System for Weather Satellite Display, How to Find the Satellite, Test Equipment, Microcomputers and the Weather Satellite Station Operations.

ISBN 0-88006-015-8 **available now! BK7383 \$8.95**

RADIO BOOKSHOP

Think Spring,

Think Antennas

VHF ANTENNA HANDBOOK—The new *VHF Antenna Handbook* details the theory, design, and construction of hundreds of different VHF and UHF antennas ... a practical book written for the average amateur who takes joy in building, not full of complex formulas for the design engineer. Packed with fabulous antenna projects you can build. BK7368 \$5.95.*

PRACTICAL ANTENNAS FOR THE RADIO AMATEUR—A manual describing how to equip a ham station with a suitable antenna. A wide range of antenna topics, systems, and accessories are presented giving the reader some food for thought and practical data for construction. Designed to aid the experienced ham and novice as well. Only BK1015 \$9.95.*

73 DIPOLE AND LONG-WIRE ANTENNAS—by Edward M. Noll W3FQJ. This is the first collection of virtually every type of wire antenna used by amateurs. Includes dimensions, configurations, and detailed construction data for 73 different antenna types. Appendices describe the construction of noise bridges, line tuners, and data on measuring resonant frequency, velocity factor, and swr. BK1016 \$5.50.*

ALL ABOUT CUBICAL QUAD ANTENNAS (2nd edition)—BK1196—The "Classic" on Quad design, theory, construction, and operation. New 2nd edition contains new feed and matching systems and new data. \$5.95

BEAM ANTENNA HANDBOOK (New 5th edition)—BK1197—Yagi beam theory, construction and operation. Information on wire beams, SWR curves and matching systems. A "must" for serious DXers. \$5.95

VHF HANDBOOK FOR RADIO AMATEURS—BK1198—Contains information on FM theory, operation and equipment, VHF antenna design and construction, satellite-EME, and the newest solid-state circuits. \$6.95

THE RADIO AMATEUR ANTENNA HANDBOOK—BK1199—All about wire antennas, beams, tuners, baluns, coax, radials, SWR and towers. Clear and complete information. \$6.95*

SIMPLE, LOW-COST WIRE ANTENNAS FOR RADIO AMATEURS—BK1200—All new data and everything you want to know about low-cost, multi-band antennas, inexpensive beams, "invisible" antennas for hams in "tough" locations. \$6.95*

ALL ABOUT CUBICAL QUAD ANTENNAS (2nd edition)—BK1196—The "Classic" on Quad design, theory, construction, and operation. New 2nd edition contains new feed and matching systems and new data. \$5.95*

A modular approach... for your own custom-designed ATV system... Here's how

TXA5-4 ATV EXCITER/MODULATOR \$89 ppd

This wired and tested module is designed to drive the Motorola MHW-710 module in the PA5 10 watt linear amp. The crystal in the 100 mHz region keeps harmonics out of two meters for talk back. The video modulator is full 8 mHz for computer graphics and color. Requires 13.8 vdc reg @ 70 ma. Tuned with xtal on 439.25, 434.0, or 426.25 mHz. Provision for sync expanding. Two frequencies available.

PA5 10 WATT ATV POWER MODULE \$89 ppd

The PA5 will put out 10 watts RMS power on the sync tips when driven with 80 mw by the TXA5 exciter. 50 ohms in and out, plus bandwidth for the whole band with good linearity for color and sound. Requires 13.8 vdc regulated @ 3 amps

FMA5 AUDIO SUBCARRIER GENERATOR

\$29 ppd

Puts audio on with your camera video just as broadcast TV does at 4.5 mHz. Puts out up to 1 v p-p to drive the TXA5 or VM-2, 3, or 4 modulators. Requires low Z mic (150 to 600 ohms), and +12 to 18 vdc @ 25 ma. Works with any xmitr with 5 mHz video bandwidth

TVC-2 ATV DOWNCONVERTER... \$55 ppd

Stripline MRF901 (1.7 db NF) preamp and double balanced mixer module digs out the weak ones but resists intermod and overload. Connects between uhf antenna and TV set tuned to channel 2 or 3. Varricap tunes 420 to 450 mHz. Requires +12 to 18 vdc @ 20 ma. Super sensitive TVC-2L with NE64535 preamp (9db NF) stage \$69 ppd

***TXA5, PA5, FMA5 and TVC Basic Module Pkg.**

Call or write for our complete list of specifications, station set-up diagrams, and optional accessories which include antennas, modulators, detectors, test generators, cameras, etc. **WE ARE A FULL-LINE SUPPLIER OF ALL YOUR ATV NEEDS.**

The Electronic Breadboard

Computer Aided Design (CAD) is one of the newest of the applications of microcomputer technology. THE ELECTRONIC BREADBOARD permits the design and analysis of analog circuits. It can be used to evaluate voltages, currents, impedance and the frequency response of any circuit.

This package is ideal for audio component repairmen, ham radio technicians, hobbyists, electrical engineers, telecommunications engineers, audio-philosophers and students of electronics. Plug it in and slice away a lot of guesswork.

THE AUTEK "QRM ELIMINATOR"

**Model QF-1A
For SSB & CW
\$73.00**

115 VAC supply built-in. Filter by-passed when off.

Auxiliary Notch rejects 80 to 11,000 Hz! Covers signals other notches can't touch.

Four main filter modes for any QRM situation.

Continuously variable main selectivity (to an incredible 20 Hz!)

Continuously variable main frequency. (250 to 2500 Hz)

AUTEK pioneered the ACTIVE AUDIO FILTER back in 1972. Today, we're still the engineering leader. Our new QF-1A is the latest example. It's INFINITELY VARIABLE. You vary selectivity 100:1 and frequency over the entire usable audio range. This lets you reject whistles with dual notches (to 70 dB), or reject SSB hiss and splatter with a fully adjustable lowpass plus aux. notch. Imagine what the NARROWEST CW FILTER MADE will do to QRM! HP rejects low frequencies. Skirts exceed 80 dB. 1 watt speaker amp.

Built-in 115 VAC supply. 6 1/2 x 5 x 2 1/2. Two-tone grey styling. Even latest rigs include only a fraction of the QF-1A selectivity. Yet it hooks up in minutes to ANY rig - Yaesu, Kenwood, Drake, Swan, Atlas, Tempo, Heath, Collins, Ten-Tec, etc. Just plug it into your phone jack and connect spkr or phones to the output. Join the thousands of owners who now hear stations they couldn't copy without a QF-1A! It really works!

WORLDS RECORD KEYS. OVER 4000 DX QSO'S IN 2 DAYS!

Model MK-1 Keyer \$104.50

Probably the most popular "professional" contest keyer in use, yet most owners are casual CW operators or novices. After a few minutes, you'll see how memory revolutionizes your CW operation! Just start sending and record your CQ, name, QTH, etc. in seconds. 1024 bits stores about 100 characters (letters, numbers). Playback at any speed. Dot/dash memories, triggered clock, repeat, combine, 5 to 50+ WPM, built-in monitor and 115 VAC supply. Works with any paddle. Sit back and relax while your MK-1 calls CQ and handles standard exchanges!

Optional memory expander (ME-1) expands any MK-1 to 400 characters. ME-1 factory installed \$35. Owner installed, only \$25. Add more memory now or later!

THE 1982 EDITION GENERAL LICENSE STUDY GUIDE

by Timothy M. Daniel NBRK

This is the complete guide to the General License. Learning rather than memorizing is the secret. This is not a question-and-answer guide that will gather dust when the FCC issues a new test. Instead, this book will be a helpful reference, useful long after a ham upgrades to General. Includes up-to-date FCC rules and an application form.

ORDER yours today and talk to the world.

NEW from **73**

THE NEW WEATHER SATELLITE HANDBOOK

BY DR. RALPH E. TAGGART

Here is the completely updated and revised edition of the best-selling **Weather Satellite Handbook**—containing all the information on the most sophisticated and effective spacecraft now in orbit. Dr. Taggart has written this book to serve both the experienced amateur satellite enthusiast and the newcomer. The book is an introduction to satellite watching, providing all the information required to construct a complete and highly effective ground station. Not just ideas, but solid hardware designs and all the instructions necessary to operate the equipment are included. For the thousands of experimenters who are operating stations, the book details all procedures necessary to modify their equipment for the new series of spacecraft. Amateur weather satellite activity represents a unique blend of interests encompassing electronics, meteorology and astronautics. Join the privileged few in watching the spectacle of earth as seen from space on your own monitoring equipment. Order BK7383 \$8.95

SAVE \$2.95

WEATHER SATELLITE HANDBOOK (first edition)

By Dr. Ralph E. Taggart WB8DQT. Valuable information in this first edition is *not included* in Dr. Taggart's just published book, **The New Weather Satellite Handbook** (see above). Chapters such as "How to Build an Electric Timer for Satellite Tracking" and "Building an Automatic Control for the Satellite Receiving Station" will no longer be available when this edition is out of print. This is a good entry level text for those discovering the exciting new use of weather satellites. Regular price: \$4.95. **SPECIAL PACKAGE PRICE—BOTH BOOKS FOR ONLY \$10.95, SAVE \$2.95!** (This offer available only while supplies last.) Order WS7300 and receive both editions of the Weather Satellite Handbook for only \$10.95 (plus \$1.00 shipping and handling charge).

*Use the order card in this magazine or itemize your order on a separate piece of paper and mail to: 73 Radio Bookshop • Peterborough NH 03458. Be sure to include check or detailed credit card information. Add \$1.50 first book, \$1.00 each additional book, \$10.00 per book foreign airmail. Note: Prices subject to change on books not published by 73 Magazine. Questions regarding your order? Please write to Customer Service at the above address. Please allow 4-6 weeks for delivery. No C.O.D. orders accepted. For Toll Free ordering call 1-800-258-5473.

NEW . . . \$99.95

The model CK-2 "CONTESTER" is part of the latest generation of famous AEA computerized electronic keyers. Like many of our other innovative electronic products, the Contester™ keyer utilizes a custom AEA microcomputer with proprietary copy-written software. The CK-2 retains virtually all the remarkable features of the CK-1 predecessor such as an automatic serial number generator, large soft-partitioned memory with editing capabilities, etc. In addition, we have added CMOS memory with internal battery keep-alive provisions, automatic repeat mode and a **lower price!** See it now so you too can appreciate the fine quality of design and craftsmanship that goes into all AEA products.

ACCESSORIES:

AC-2 350 Ma 12 VDC Wall Adaptor \$9.95
DC-2 Mating Rechargeable 8 hour Battery Pack and Charger \$39.95

Sound Effects Kit \$18.50

The SE-01 Sound Effects Kits has all you need to build a programmable sound effects machine except a battery and speaker. Only the SE-01 provides you with additional circuitry that includes a Pulse Generator, Mix Oscillator and Comparator to make more complex sounds. Includes instructions and programming examples. You can easily create Gunshots, Explosions, Steam Trains, Wind & Surf and much more.

Complete Kit **\$18.50**
With quality PC Board (Less battery & speaker) **76477** High is included
Extra chips **\$3.15 ea.**

ELECTRONIC MUSIC MAKER

THIS UNIQUE KIT CONTAINS A MICROPROCESSOR CHIP WITH ROM. IT HAS BEEN PROGRAMMED TO PLAY THE FIRST 8 TO 10 NOTES OF THE TUNES LISTED BELOW. CONSTRUCTION IS SIMPLE, WORKS WITH ANY 8 OR 16 OHM SPKR. (NOT INCLUDED). THE KIT WILL OPERATE ON 12VDC OR 12VAC WITH OPTIONAL TRANSFORMER. (CONVERTS TO 117VAC). ALL COMPONENTS & BOARD Complete Kit **\$16.95** Transformer **\$1.35**

Tunes included: William Tell - Hallstatt Chorus, Star Spangled Banner - Yankee Doodle - America - America - Deutschland Lied - Wedding March - Brahms' 4th and 6th - Händel's L'Air de Reine - Star Wars Theme - Clementine - Augustine - Blue Bird - God Save The Queen - Colonel Bogey - Warhig's "O Sole Mio" - Santa Lucia - The End - Blue Danube - Brahms Lullaby - Westminster Chime - Simple Chime - Descending Octave Chime

Regulator Card Kit \$14.95

This is the Regulator Card from our famous 200A Power Supply Kit. Although we ran out of the transformers and heatinks many customers have been able to locate their own. The regulator card performs the actual voltage regulation and has adjustable fold back current limiting. Output voltage is stable to 200mV from 0 to 20 Amps and adjustable from 11 to 15 Volts. Designed to drive 2 high current NPN transistors (2N3771 2N5301 or equivalent). The unit assemblies quickly included are all on the board components including a driver transistor and over-temp shutdown sensor. Designed to screw down to standard 3/8" diameter computer grade filter cap. The quality plated PC card is 3.1" x 4.3".

REGULATOR CARD KIT **\$14.95**
HIGH CURRENT PARTS (2 - 2N3772 & 2SA Bridge) **\$5.00**
51,000 MFD @ 40V Computer Grade **\$3.50**
Requires Transformer with 15 - 15VAC Out @ The Current You Expect To Draw

THE SUPER MUSIC MAKER KIT REVISION 2 - \$24.95

Now you can play hundreds of songs using the Bullet Super Music Maker. The unit features a single factory programmed microprocessor IC that comes with 20 pre-programmed short tunes. By adding the additional PROMS (2708's) the system can be expanded to play up to 1000 notes per PROM. The kit comes with all electronic components (less the PROMs) and a drilled plated and screened PC Board which measures 4" x 4". The 7 watt amplifier section is on the same PC board and drives an 8 ohm speaker (not included). Since the unit works on 12 VDC or 12 VAC vehicle or portable operation is possible. What do you get for \$24.95? Everything but a speaker. Transformer, case switches and PROMs. Additional 2708 PROMs album containing popular tunes are available for \$9.95 each. Lists of available PROM albums are available on request.

DIP Switches One 8 pos. One 5 pos. **2.00/Set**
Can be directly soldered to PC Bd to access (tunes)
Rotary Switches Two 5 position **2.50/Set**
For remote wiring to PC Bd to access (tunes)
Attractive Tan Plastic Case **6.50**
Wallplug Transformer **3.00**
(for operation on 117VAC house voltage)

SURGE SHUNT

protects solid state communications equipment from damage caused by high-voltage transients entering the antenna system

These transients usually are caused by atmospheric static discharges or nearby lightning strikes. The new Model 1549 Surge Shunt can be used with both receivers and transceivers having up to 200 watts output. Convenient UHF type coaxial connections are supplied. Price is \$24.95. The arrester "pill" element has a long life, but can be easily and economically replaced if necessary.

NEW, MOLDABLE PLASTIC

COAX-SEAL®

Seals coax fittings from moisture and corrosion

- Only material that will adhere to poly vinyl or vinyl outer coax jackets.
 - Forms and seals over odd shaped and difficult fittings
 - Non-contaminating and non-conductive.
 - Wide ambient temperature range (-30°F to +180°F)
 - Stays flexible for years thus insuring moisture proof connections
 - Reuseable - allows you to quickly disconnect fittings and reseal them with the same material
 - A must for satellite TV - microwave work - wire antenna at solder joints - in the shack.
- Packaged in convenient 1/2" x 60" roll.

At your dealer or 2 rolls \$5.50 postpaid

NEW AUTOPATCH

Now at last, an autopatch designed for the sophisticated FM Amateur. "Private Patch" works through existing repeaters as well as simplex. Gives you access to your home phone within the coverage area of any selected repeater. "Private Patch" requires no modifications to your base FM transceiver. Connects only to MIC and speaker jacks. Conversation is very natural because "Private Patch" does not use the sampling technique. CW ID sends your call. Five digit owner programmable access code and operator/long distance inhibit protect your phone bill. Self contained AC supply. No tone encoders required. All CMOS digital logic, no analog timing used. Compare our standard features. Send for additional information. Available in spring.

AMP LETTER

(AMP LETTER) n. 1. An Amateur Radio publication devoted to the design, construction, and operation of Amateur Amplifiers.

2. A newsletter that can save you money on your next amplifier construction project.
3. A source of parts and information.

The AMP-LETTER is published and mailed First Class every three weeks (17 times/year). It is organized into five departments:

- I Editor's Corner
- II Letters
- III Tech Topics & Tips
- IV Feature Article
- V AMP-LETTER TRADER

Have parts to sell? Run an ad in the AMP-LETTER TRADER. Subscriber rate is 10¢ per word.

The AMP-LETTER believes that homebrewing an amp can be fun, educational, and half as costly as buying a commercial amp.

A one year subscription to the AMP-LETTER is \$19.00/year (17 issues). Mention "73" Magazine and you may subscribe at the special one time rate of \$15.00/year.

Introducing TVRO CIRCUIT BOARDS Satellite Receiver Boards—Now in Stock

DUAL CONVERSION BOARD \$25.00

This board provides conversion from the 3.7-4.2 band first to 900 MHz where gain and bandpass filtering are provided and, second, to 70 MHz. The board contains both local oscillators, one fixed and the other variable, and the second mixer. Construction is greatly simplified by the use of Hybrid IC amplifiers for the gain stages.

SIX 47pF CHIP CAPACITORS

For use with dual conversion board \$6.00

70 MHz IF BOARD \$25.00

This circuit provides about 43dB gain with 50 ohm input and output impedance. It is designed to drive the HOWARD/COLEMAN TVRO Demodulator. The on-board bandpass filter can be tuned for bandwidths between 20 and 35 MHz with a passband ripple of less than 1/2 dB. Hybrid IC's are used for the gain stages.

SEVEN .01 pF CHIP CAPACITORS

For use with the 70 MHz IF board \$7.00

DEMODULATOR BOARD \$40.00

This circuit takes the 70 MHz center frequency satellite TV signals in the 10 to 200 millivolt range, detects them using a phase locked loop, de-emphasizes and filters the result and amplifies the result to produce standard NTSC video. Other outputs include the audio subcarrier, a DC voltage proportional to the strength of the 70 MHz signal, and AFC voltage centered at about 2 volts DC.

SINGLE AUDIO \$15.00

This circuit recovers the audio signals from the 6.8 MHz frequency. The Miller 9051 coils are tuned to pass the 6.8 MHz subcarrier and the Miller 9052 coil tunes for recovery of the audio.

DUAL AUDIO \$25.00

Duplicate of the single audio but also covers the 6.2 range.

DC CONTROL \$15.00

SPECIAL SET OF FIVE BOARDS \$100.00

INCLUDING DUAL AUDIO (2 single audio boards)

1900 to 2500 MHz MICROWAVE DOWNCONVERTER

MICROWAVE RECEIVER This receiver is tunable over a range of 1900 to 2500 MHz approximately, and is intended for amateur use. The local oscillator is voltage controlled, making the I.F. range approximately 54 to 88 MHz for standard TV set channels 2 thru 7.

3—5 units	64.50 each	57%
6—11 units	62.50 each	58%
12—23 units	60.75 each	59%

On all orders of 12 or more, we pay the freight! This is your opportunity to stock up for the Christmas buying season. These are ideal gift items, that will really move out!

ESCORT MARK III SPECIFICATIONS

VHF DUPLEXERS

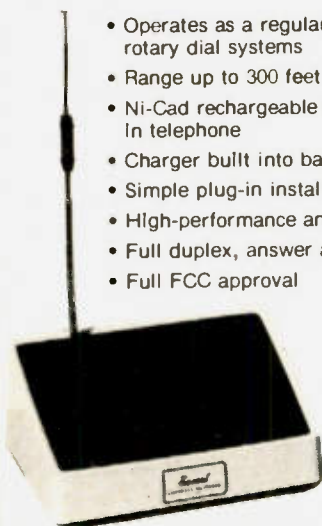

This duplexer was made for RF Harris Mobile Phones and Two Way Radios. These duplexers can be used in any mobile phone or two way radio system, along with having the capabilities to be modified for UHF use. The physical dimensions are 3 3/5" Long, 4 2/5" Wide, and 1 1/10" Deep. The approximate weight is 18 oz./1 lb. 2 oz.. PRICE \$74.99

- Operates as a regular telephone on touch-tone or rotary dial systems
- Range up to 300 feet
- Ni-Cad rechargeable batteries included in telephone
- Charger built into base transmitter
- Simple plug-in installation!
- High-performance antenna
- Full duplex, answer and dial out
- Full FCC approval

HOW WE CUT THE CORD.

The new Cordless Phone works on a simple, highly sophisticated principle. A small base station plugs into your regular phone jack, and an electrical wall outlet. The base station then transmits any in- or out-going call to the handheld receiver, anywhere up to 300 feet.

ORDERING INSTRUCTIONS

DEFECTIVE MATERIAL: All claims for defective material must be made within sixty (60) days after receipt of parcel. All claims must include the defective material (for testing purposes), our invoice number, and the date of purchase. All returns must be packed properly or it will void all warranties.

DELIVERY: Orders are normally shipped within 48 hours after receipt of customer's order. If a part has to be backordered the customer is notified. Our normal shipping method is via First Class Mail or UPS depending on size and weight of the package. On test equipment it is by Air only, FOB shipping point.

FOREIGN ORDERS: All foreign orders must be prepaid with cashier's check or money order made out in U.S. Funds. We are sorry but C.O.D. is not available to foreign countries and Letters of Credit are not an acceptable form of payment either. Further information is available on request.

HOURS: Monday thru Saturday: 8:30 a.m. to 5:00 p.m.

INSURANCE: Please include 25¢ for each additional \$100.00 over \$100.00, United Parcel only.

ORDER FORMS: New order forms are included with each order for your convenience. Additional forms are available on request.

POSTAGE: Minimum shipping and handling in the US, Canada, and Mexico is \$2.50 all other countries is \$5.00. On foreign orders include 20% shipping and handling.

PREPAID ORDERS: Order must be accompanied by a check.

PRICES: Prices are subject to change without notice.

RESTOCK CHARGE: If parts are returned to MHZ Electronics due to customer error, customer will be held responsible for all extra fees, will be charged a 15% restocking fee, with the remainder in credit only. All returns must have approval.

SALES TAX: Arizona must add 5% sales tax, unless a signed Arizona resale tax card is currently on file with MHZ Electronics. All orders placed by persons outside of Arizona, but delivered to persons in Arizona are subject to the 5% sales tax.

SHORTAGE OR DAMAGE: All claims for shortages or damages must be made within 5 days after receipt of parcel. Claims must include our invoice number and the date of purchase. Customers which do not notify us within this time period will be held responsible for the entire order as we will consider the order complete.

OUR 800 NUMBER IS STRICTLY FOR ORDERS ONLY
NO INFORMATION WILL BE GIVEN. 1-800-528-0180.

(B)	9dB	9dB
	PRICE \$49.99	PRICE \$39.99

**FREQUENCY SOURCES, INC MODEL MS-74X
MICROWAVE SIGNAL SOURCE**
 MS-74X: Mechanically Tunable Frequency Range (MHz) 10630 to
 11230 (10.63 to 11.23GHz) Minimum Output Power (mW) 10, Overall
 Multiplier Ratio 108, Internal Crystal Oscillator Frequency Range
 (MHz) 98.4 to 104.0, Maximum Input Current (mA) 400.

The signal source are designed for applications where high stability
 and low noise are of prime concern. these sources utilize fundamen-
 tal transistor oscillators with high Q coaxial cavities, followed by
 broadband stable step recovery diode multipliers. This design
 allows single screw mechanical adjustment of frequency over stan-
 dard communications bands. Broadband sampling circuits are used
 to phase lock the oscillator to a high stability reference which may
 be either an internal self-contained crystal oscillator, external
 primary standard or VHF synthesizer. This unique technique allows
 for optimization of both FM noise and long term stability. List Price
 is \$1158.00 (THESE ARE NEW) **Our Price—\$289.**

HEWLETT PACKARD 1N5712 MICROWAVE DIODE
 This diode will replace the MBD101, 1N5711, 5082-2800,
 5082-2835 ect. This will work like a champ in all those
 Down Converter projects. **\$1.50 or 10/\$10.00**

**MOTOROLA MHW1172R LOW DISTORTION
WIDEBAND AMPLIFIER MODULE.**
 Frequency Range: 40 to 300 MHz., Power Gain at 50MHz
 16.6min. to 17.4max., Gain Flatness ± 0.1 Typ. ± 0.2
 Max. dB., DC Supply Voltage - 28vdc, RF Voltage Input
 + 70dBmV **PRICE \$29.99**

GENERAL ELECTRIC AA NICADS
 Model #41B905HD11-G1
 Pack of 6 for \$5.00 or 60 Cells, 10 Packs for \$45.00
 These may be broken down to individual cells.

ORDERING INSTRUCTIONS

TERMS: DOMESTIC: Prepaid, C.O.D. or Credit Card

FOREIGN: Prepaid only, U.S. Funds—money order or cashier's check only.

C.O.D.: Acceptable by telephone or mail. Payment from customer will be by cash, money order or cashier's
 check. We are sorry but we cannot accept personal checks for C.O.D.'s.

CONFIRMING ORDERS: We would prefer that confirming orders not be sent after a telephone order has been
 placed. If company policy necessitates a confirming order, please mark "CONFIRMING" boldly on the order.
 If problems or duplicate shipments occur due to an order which is not properly marked, customers will be
 held responsible for any charges incurred, plus a 15% restock charge on returned parts.

CREDIT CARDS: WE ACCEPT MASTERCARD VISA AND AMERICAN EXPRESS.

DATA SHEETS: When we have data sheets in stock on devices we do supply them with the order.

MINI KITS - YOU HAVE SEEN THESE BEFORE NOW HERE ARE OLD FAVORITE AND NEW ONES TOO. GREAT FOR THAT AFTERNOON HOBBY.

FM MINI MIKE

A super high performance FM wireless mike kit! Transmits a stable signal up to 300 yards with exceptional audio quality by means of its built in electret mike. Kit includes case, mike, on-off switch antenna, battery and super instructions. This is the finest unit available

FM-3 Kit \$14.95
FM-3 Wired and Tested 19.95

Color Organ

See music come alive! 3 different lights flicker with music. One light each for, high, mid-range and lows. Each individually adjustable and drives up to 300 W runs on 110 VAC

Complete kit, ML-1 \$8.95

Video Modulator Kit
Converts any TV to video monitor. Super stable, tunable over ch. 4-6. Runs on 5-15V accept std. video signal. Best unit on the market! Complete kit, VD-1 \$7.95

Led Blinky Kit
A great attention getter which alternately flashes 2 jumbo LEDs. Use for name badges, buttons, warning panel lights, anything! Runs on 3 to 15 volts. Complete kit, BL-1 \$2.95

Super Steuth
A super sensitive amplifier which will pick up a pin drop at 15 feet! Great for monitoring baby's room or as general purpose amplifier. Full 2 W rms output, runs on 6 to 15 volts, uses 8-45 ohm speaker. Complete kit, BN-9 \$5.95

CPD-1
Runs on 3-12 Vdc 1 watt out. 1 KHZ good for CPD, Alarm, Audio Oscillator. Complete kit \$2.95

CLOCK KITS

Your old favorites are here again. Over 7,000 Sold to Date. Be one of the gang and order yours today!

Try your hand at building the finest looking clock on the market. Its satin finish anodized aluminum case looks great anywhere, while six .4" LED digits provide a highly readable display. This is a complete kit, no extras needed, and it only takes 1-2 hours to assemble. Your choice of case colors: silver, gold, black (specify).
Clock kit, 12/24 hour, DC-5 \$24.95
Clock with 10 min. ID timer, 12/24 hour, DC-10 \$29.95
Alarm clock, 12 hour only, DC-8 \$29.95
12V DC car clock, DC-7 \$29.95

For wired and tested clocks add \$10.00 to kit price. SPECIFY 12 OR 24 HOUR FORMAT

FM Wireless Mike Kit

Transmits up to 300' to any FM broadcast radio, uses any type of mike. Runs on 3 to 9V. Type FM-2 has added sensitive mike preamp stage

FM-1 kit \$3.95 FM-2 kit \$4.95

Whisper Light Kit

An interesting kit, small mike picks up sounds and converts them to light. The louder the sound, the brighter the light. Includes mike, controls up to 300 W, runs on 110 VAC. Complete kit, WH-1 \$6.95

Tone Decoder

A complete tone decoder on a single PC board. Features 400-5000 Hz adjustable range via 20 turn pot, voltage regulation, 567 IC. Useful for touch-tone burst detection, FSK, etc. Can also be used as a stable tone encoder. Runs on 5 to 12 volts. Complete kit, TD-1 \$5.95

Car Clock

The UN-KIT, only 5 solder connections

Here's a super looking rugged and accurate auto clock which is a snap to build and install. Clock movement is completely assembled - you only solder 3 wires and 2 switches. Takes about 15 minutes! Display is bright green with automatic brightness control. Photocell assures you of a highly readable display day or night. Comes in a satin finish anodized aluminum case which can be attached 5 different ways using 2 side lugs. Choice of silver, black or gold case (specify).
DC-3 kit, 12 hour format \$22.95
DC-3 wired and tested \$29.95

Calendar Alarm Clock

The clock that's got it all! 6-5 LEDs, 12-24 hour snooze, 24 hour alarm, 4 year calendar, battery backup and lots more. The super 7001 chip is used. Size 5x4x2 inches. Complete kit, less case (not available) DC-9 \$34.95

Under Dash Car Clock

12-24 hour clock in a beautiful plastic case. Features 6 jumbo RED LEDs, high accuracy (100%), easy 3 wing hook-up. Display blanks with ignition and super instructions. Optional dimmer automatically adjusts display to ambient light level. DC 11 clock with mig bracket \$27.95
DM-1 dimmer adapter \$2.50
Add \$10.00 Assy. and Test

Video Terminal

A completely self-contained stand alone video terminal card. Requires only an ASCII keyboard and TV set to become a complete terminal unit. Features are: single 5V supply, TTL controlled sync and baud rates to 9600; complete computer and keyboard control of cursor; parity error control and display. Accepts and generates serial ASCII plus parallel keyboard input. The 6416 is 64 char by 16 lines with scrolling, upper and lower case (optional) and has RS-232 and 20ma loop interfaces on board. Kits include sockets and complete documentation.
RE 6416 terminal card kit (add \$60.00 for wired unit) \$189.95
Lower Case option \$13.95
Power Supply \$16.95
RF Modulator kit \$7.95

Universal Timer Kit

Provides the basic parts and PC board required to provide a source of precision timing and pulse generation. Uses 555 timer IC and includes a range of parts for most timing needs.

UT-5 Kit \$5.95

Mad Blaster Kit

Produces LOUD ear shattering and attention getting siren like sound. Can supply up to 15 watts of obnoxious audio. Runs on 6-15 VDC.

MB-1 Kit \$4.95

Siren Kit

Produces upward and downward wail characteristic of a police siren. 5 W peak audio output, runs on 3-15 volts, uses 3-45 ohm speaker. Complete kit, SM-3 \$2.95

60 Hz Time Base
Runs on 5-15 VDC, Low current (2.5ma), 1 min month accuracy. TB-7 kit \$5.95

Audio Prescaler
Make high resolution audio measurements, great for musical instrument tuning, PL tones, etc. Multiplies audio UP in frequency, selectable x10 or x100, gives .01 HZ resolution with 1 sec gate time! High sensitivity of 25 mv. 1 meg input z and built-in filtering gives great performance. Runs on 9V battery, all CMOS.
PS-2 kit \$29.95
PS-2 wired \$39.95

600 MHz PRESCALER
Extend the range of your counter to 600 MHz. Works with all counters. Less than 150 mv sensitivity. specify -10 or -100.
Wired, tested, PS-1B \$59.95
Kit, PS-1B \$44.95

30 Watt 2 mtr PWR AMP
Simple Class C power amp features 8 times power gain. 1 W in for 8 out, 2 W in for 15 out, 4 W in for 30 out. Max output of 35 W, incredible value, complete with all parts, less case and T-R relay.
PA-1, 30 W pwr amp kit \$22.95
TR-1, RF sensed T-R relay kit 6.95

Power Supply Kit
Complete triple regulated power supply provides variable 6 to 18 volts at 200 ma and +5 at 1 Amp. Excellent load regulation, good filtering and small size. Less transformers, requires 6 3 V 1/4 A and 24 VCT.
Complete kit PS-3LT \$6.95

RF actuated relay senses RF (1W) and closes DPDT relay.
For RF sensed T-R relay TR-1 Kit \$6.95

OP-AMP Special
BI-FET LF 13741 - Direct pin for pin 741 compatible, but 500,000 MEG input z, super low 50 pa input current, low power drain.
50 for only \$9.00 10 for \$2.00

Regulators
78M \$1.25
79M \$1.25
723 \$5.50
309K \$1.15
7805 \$1.00

Shrink Tubing Nubs
Nice precut pcs of shrink size 1" x 1/8" shrink to 1/4" Great for splices 50/\$1.00

Mini TO-92 Heat Sinks
Thermalloy Brand 5 for \$1.00
TO-220 Heat Sinks 3 for \$1.00

Opto Isolators - 4N28 type
Opto Reflectors - Photo diode + LED \$5.00 ea.
\$1.00 ea.

Molex Pins
Molex already precut in length of 7. Perfect for 14 pin sockets. 20 strips for \$1.00

CDS Photo Cells
Resistance varies with light. 250 ohms to 1000 ohms over 3 meg.

FM-5 PC Board Kit - **ONLY \$159.95**
complete with controls, heatsink, etc.

SAVE A BUNDLE ON VHF FM TRANSCEIVERS!

10 watts, 5 Channels, for 6M, 2M, or 220

★ **SPECIAL OFFER** ★
Free cabinet kit, complete with speaker, knobs, connectors, hardware. A \$59.95 value, yours free with purchase of kit. Hurry! Offer limited. ★

HIGH QUALITY FM MODULES FOR REPEATERS, LINKS, TELEMETRY, ETC.

- **R76 VHF FM RECEIVER** for 10M, 6M, 2M, 220, or commercial bands. Fantastic selectivity options. Kits from \$84.95 to \$109.95
- **R450 UHF FM RECEIVER** for 380-520 MHz bands. Kits in selectivity options from \$94.95
- **R110 VHF AM RECEIVER** Kit for vhf aircraft band or ham bands. Only \$84.95.

- **COR KITS** With audio mixer and speaker amplifier. Only \$29.95.
- **CWID KITS** 158 bits, field programmable, clean audio. Only \$59.95.
- **A16 RF TIGHT BOX** Deep drawn alum. case with tight cover and no seams. 7 x 8 x 2 inches. Only \$18.00.
- **SCANNER CONVERTERS** Copy 72-76, 135-144, 240-270, 400-420, or 806-894 MHz bands on any scanner. Wired/tested Only \$79.95.

- **T51 VHF FM EXCITER** for 10M, 6M, 2M, 220 MHz or adjacent bands. 2 Watts continuous. Kits only \$54.95.
- **T451 UHF FM EXCITER** 2 to 3 Watts on 450 ham band or adjacent. Kits only \$64.95.
- **VHF & UHF LINEAR AMPLIFIERS.** Use on either FM or SSB. Power levels from 10 to 45 Watts to go with exciters & xmtg converters. Kits from \$69.95.

VHF & UHF TRANSMITTING CONVERTERS

For SSB, CW, ATV, FM, etc. Available for 6M, 2M, 220, 440 with many IF input ranges. Converter board kit only at \$79.95 (VHF) or \$99.95 (UHF) or kits complete with PA and cabinet as shown.

VHF & UHF RECEIVING CONVERTERS

20 Models cover every practical rf and if range to listen to SSB, FM, ATV, etc. on 6M, 2M, 220, 440, and 110 aircraft band. Even convert weather down to 2M! Kits from \$39.95 and wired units.

VHF & UHF RECEIVER

PREAMPS. Low noise.

VHF Kits from 27 to 300 MHz. UHF Kits from 300 to 650 MHz. Broadband Kits: 20-650 MHz. Prices start at \$14.95 (VHF) and \$18.95 (UHF). All preamps and converters have noise figure 2dB or less.

Hamtronics® is a registered trademark

ramsey

the first name in Counters!

9 DIGITS 600 MHz \$129⁹⁵ WIRED

PRICES:

CT-90 wired, 1 year warranty	\$129.95
CT-90 Kit, 90 day parts warranty	
ramsey	109.95
AC-1 AC adapter	3.95
BP-1 Nicad pack + AC Adapter/Charger	12.95
OV-1 Micro-power Oven time base	49.95
External time base input	14.95

The CT-90 is the most versatile, feature packed counter available for less than \$300.00! Advanced design features include: three selectable gate times, nine digits, gate indicator and a unique display hold function which holds the displayed count after the input signal is removed! Also, a 10MHz TCXO time base is used which enables easy zero beat calibration checks against WWV. Optionally, an internal nicad battery pack, external time base input and Micro-power high stability crystal oven time base are available. The CT-90, performance you can count on!

SPECIFICATIONS:

Range:	20 Hz to 600 MHz
Sensitivity:	Less than 10 MV to 150 MHz Less than 50 MV to 500 MHz
Resolution:	0.1 Hz (10 MHz range) 1.0 Hz (60 MHz range) 10.0 Hz (600 MHz range)
Display:	9 digits 0.4" LED
Time base:	Standard-10,000 MHz, 1.0 ppm 20-40°C Optional Micro-power oven-0.1 ppm 20-40°C
Power:	8-15 VAC @ 250 ma

7 DIGITS 525 MHz \$99⁹⁵ WIRED

SPECIFICATIONS:

Range:	20 Hz to 525 MHz
Sensitivity:	Less than 50 MV to 150 MHz Less than 150 MV to 500 MHz
Resolution:	1.0 Hz (5 MHz range) 10.0 Hz (50 MHz range) 100.0 Hz (500 MHz range)
Display:	7 digits 0.4" LED
Time base:	1.0 ppm TCXO 20-40°C
Power:	12 VAC @ 250 ma

The CT-70 breaks the price barrier on lab quality frequency counters. Deluxe features such as: three frequency ranges - each with pre-amplification, dual selectable gate times, and gate activity indication make measurements a snap. The wide frequency range enables you to accurately measure signals from audio thru UHF with 1.0 ppm accuracy - that's .0001%! The CT-70 is the answer to all your measurement needs, in the field, lab or ham shack.

PRICES:

CT-70 wired, 1 year warranty	\$99.95
CT-70 Kit, 90 day parts warranty	
ramsey	84.95
AC-1 AC adapter	3.95
BP-1 Nicad pack + AC adapter/charger	12.95

7 DIGITS 500 MHz \$79⁹⁵ WIRED

PRICES:

MINI-100 wired, 1 year warranty	\$79.95
AC-Z Ac adapter for MINI-100	3.95
BP-Z Nicad pack and AC adapter/charger	12.95

Here's a handy, general purpose counter that provides most counter functions at an unbelievable price. The MINI-100 doesn't have the full frequency range or input impedance qualities found in higher price units, but for basic RF signal measurements, it can't be beat! Accurate measurements can be made from 1 MHz all the way up to 500 MHz with excellent sensitivity throughout the range, and the two gate times let you select the resolution desired. Add the nicad pack option and the MINI-100 makes an ideal addition to your tool box for "in-the-field" frequency checks and repairs.

SPECIFICATIONS:

Range:	1 MHz to 500 MHz
Sensitivity:	Less than 25 MV
Resolution:	100 Hz (slow gate) 1.0 KHz (fast gate)
Display:	7 digits, 0.4" LED
Time base:	2.0 ppm 20-40°C
Power:	5 VDC @ 200 ma

8 DIGITS 600 MHz \$159⁹⁵ WIRED

NEW READ RECEIVER FREQUENCY

SPECIFICATIONS:

Range:	20 Hz to 600 MHz
Sensitivity:	Less than 25 mv to 150 MHz Less than 150 mv to 600 MHz
Resolution:	1.0 Hz (60 MHz range) 10.0 Hz (600 MHz range)
Display:	8 digits 0.4" LED
Time base:	2.0 ppm 20-40°C
Power:	110 VAC or 12 VDC

The CT-50 is a versatile lab bench counter that will measure up to 600 MHz with 8 digit precision. And, one of its best features is the Receive Frequency Adapter, which turns the CT-50 into a digital readout for any receiver. The adapter is easily programmed for any receiver and a simple connection to the receiver's VFO is all that is required for use. Adding the receiver adapter in no way limits the operation of the CT-50, the adapter can be conveniently switched on or off. The CT-50, a counter that can work double duty!

BP-3, Nicad pack + AC adapter/charger	19.95
MP-1, Probe kit	2.95

The DM-700 offers professional quality performance at a hobbyist price. Features include: 26 different ranges and 5 functions, all arranged in a convenient, easy to use format. Measurements are displayed on a large 3 1/2 digit, 1/2 inch LED readout with automatic decimal placement, automatic polarity, overrange indication and overload protection up to 1250 volts on all ranges, making it virtually goof-proof! The DM-700 looks great, a handsome, jet black, rugged ABS case with convenient retractable tilt ball makes it an ideal addition to any shop.

SPECIFICATIONS:

DC/AC volts:	100uV to 1 KV, 5 ranges
DC/AC current:	0.1uA to 2.0 Amps, 5 ranges
Resistance:	0.1 ohms to 20 Megohms, 6 ranges
Input impedance:	10 Megohms, DC/AC volts
Accuracy:	0.1% basic DC volts
Power:	4 °C cells

AUDIO SCALER

For high resolution audio measurements, multiplies UP in frequency.

- Great for PL tones
- Multiplies by 10 or 100
- 0.01 Hz resolution

\$29.95 Kit \$39.95 Wired

ACCESSORIES

Telescopic whip antenna - BNC plug	\$ 7.95
High impedance probe, light loading	15.95
Low pass probe, for audio measurements	15.95
Direct probe, general purpose usage	12.95
Tilt bail, for CT 70, 90, MINI-100	3.95
Color burst calibration unit, calibrates counter against color TV signal	14.95

COUNTER PREAMP

For measuring extremely weak signals from 10 to 1,000 MHz. Small size, powered by plug transformer-included.

- Flat 25 db gain
- BNC Connectors
- Great for sniffing RF with pick-up loop

\$34.95 Kit \$44.95 Wired

ramsey electronic's, inc.

TERMS

Satisfaction guaranteed - examine for 10 days, if not pleased return in original form for refund. Add \$5 for shipping insurance to a maximum of \$10. Overseas add 15% COD add \$2. Orders under \$10 add \$1.50. NY residents add 7% tax.

DIGITAL RESEARCH: PARTS

"TOP QUALITY PARTS FOR LESS"

THE M.O.H.O.

(Sensational New Hold Device For Your Phone)

A Digital Research Exclusive. This handy item allows your home phone the **HOLD** option, formerly available only to the businessman. Enjoy the convenience of placing calling party on hold without monthly charges!

- Activates using the "★" button on your phone.
- Pleasant "Tone" to remind caller he is on hold.
- Unique 4 minute cutoff if calling party is forgotten.
- Can be used to provide music for the calling party.
- FCC Approved.

MOHO is accessible from any phone in your home.

OUR BEST-SELLING MULTI-BAND!

MDR-GAIN

- One half the length of conventional half-wave dipoles
- Multi-band, Multi-frequency
- Maximum efficiency — no traps, loading coils, or stubs
- Fully assembled and pre-tuned — no measuring, no cutting
- All weather rated — 1 KW AM, 2.5 KW CW or PEP SSB
- Proven performance — more than 10,000 have been delivered
- Permit use of the full capabilities of today's 5-band xcvs
- One feedline for operation on all bands.

NEW

"DX-traordinary."

Superior dynamic range, auto. antenna tuner, QSK, dual NB, 2 VFO's, general coverage receiver.

TS-930S

The TS-930S is a superlative, high performance, all-solid state, HF transceiver keyed to the exacting requirements of the DX and contest operator. It covers all Amateur bands from 160 through 10 meters, and incorporates a 150 kHz to 30 MHz general coverage receiver having an excellent dynamic range. Among its other important features are, SSB slope tuning, CW VBT, IF notch filter, CW pitch control, dual digital VFO's, CW full break-in, automatic antenna tuner, and a higher voltage operated solid state final amplifier. It is available with or without the AT-930 automatic antenna tuner built-in.

TS-930S FEATURES:

- **160-10 Meters, with 150 kHz - 30 MHz general coverage receiver.** Covers all Amateur frequencies from 160-10 meters, including new WARC, 30, 17, and 12 meter bands, on SSB, CW, FSK, and AM. Features 150 kHz - 30 MHz general coverage receiver. Separate Amateur band access keys allow speedy band selection. UP/DOWN bandswitch changes in 1-MHz steps. A new, innovative, quadruple conversion, digital PLL synthesized circuit provides superior frequency accuracy and stability, plus greatly enhanced selectivity.
- **Excellent receiver dynamic range.** Receiver two-tone dynamic range, 100 dB typical (20 meters, 500 Hz CW bandwidth, at sensitivity of 0.25 μ v, S/N 10 dB), provides the ultimate in rejection of IM distortion.
- **All solid state, 28 volt operated final amplifier.** The final amplifier operates on 28 VDC for lowest IM distortion. Power input rated at 250 W on SSB, CW, and FSK, and at 80 W on AM. Final amplifier protection circuit with cooling fan, SWR/Power meter built-in.
- **Automatic antenna tuner, built-in.** Available with AT-930 antenna tuner built-in, or as an option. Covers Amateur bands 80-10 meters, including the new WARC bands. Tuning range automatically

pre-selected with band selection to minimize tuning time. "AUTO-THRU" switch on front panel.

- **CW full break-in.** CW full break-in circuit uses CMOS logic IC plus reed relay for maximum flexibility, coupled with smooth, quiet operation. Switchable to semi-break-in.
- **Dual digital VFO's.** 10-Hz step dual digital VFO's include band information. Each VFO tunes continuously from band to band. A large, heavy, flywheel type knob is used for improved tuning ease. T.F. Set switch allows fast transmit frequency setting for split-frequency operations. A-B switch for equalizing one VFO frequency to the other. VFO "Lock" switch provided. RIT control for ± 9.9 kHz receive frequency shift.
- **Eight memory channels.** Stores both frequency and band information. VFO-MEMO switch allows use of each memory as an independent VFO. (the original memory frequency can be recalled at will), or as a fixed frequency. Internal Battery memory back-up, estimated 1 year life. (Batteries not Kenwood supplied).
- **Dual mode noise blanker ("pulse" or "woodpecker").** NB-1, with threshold control, for pulse-type noise. NB-2 for longer duration "woodpecker" type noise.
- **SSB IF slope tuning.** Allows independent adjustment of the low and/or high frequency slopes of the IF passband, for best interference rejection.
- **CW VBT and pitch controls.** CW VBT (Variable Bandwidth Tuning) control tunes out interfering signals. CW pitch controls shifts IF passband and simultaneously changes the pitch of the beat frequency. A "Narrow/Wide" filter selector switch is provided.
- **IF notch filter.** 100-kHz IF notch circuit gives deep, sharp, notch, better than -40 dB.
- **Audio filter built-in.** Tuneable, peak-type audio filter for CW.
- **AC power supply built-in.** 120, 220, or 240 VAC, switch selected (operates on AC only).

- **Fluorescent tube digital display.** Fluorescent tube digital display has analog type sub-scale with 20-kHz steps. Separate 2 digit display indicates RIT frequency shift.
- **RF speech processor.** RF clipper type processor provides higher average "talk-power," plus improved intelligibility. Separate "IN" and "OUT" front panel level controls.
- **One year warranty.** The TS-930S carries a one year limited warranty on parts and labor.
- **Other features:**
 - SSB monitor circuit, 3 step RF attenuator, VOX, and 100-kHz marker.
- **Optional accessories:**
 - AT-930 automatic antenna tuner.
 - SP-930 external speaker with selectable audio filters.
 - YG-455C-1 (500 Hz) or YG-455CN-1 (250 Hz) plug-in CW filters for 455-kHz IF.
 - YK-88C-1 (500 Hz) CW plug-in filter for 8.83-MHz IF.
 - YK-88A-1 (6 kHz) AM plug-in filter for 8.83-MHz IF.
 - MC-60 (S-8) deluxe desk microphone with UP/DOWN switch.
 - TL-922A linear amplifier.
 - SM-220 station monitor.
 - HC-10 digital world clock.
 - HS-6, HS-5, HS-4 headphones.

More information on the TS-930S is available from all authorized dealers of Trio-Kenwood Communications 1111 West Walnut Street, Compton, California 90220
