MISCELLANEOUS.

USE OF 800 METERS.

Radio operators are cautioned that the use of 800 meters for commercial messages is in violation of the act of August 13, 1912, and the International Convention service regulations. This wave length is reserved exclusively for radio compass work. Any operator using 800 meters for commercial traffic may expect to have his license suspended or revoked.

AMENDMENTS TO REGULATIONS.

To radio inspectors and others concerned:

Paragraph 57, page 55, amended December 1, 1921, to read:

CLASS 2.—Limited commercial stations are not open to public service and are licensed for a specific commercial service or services defined in the license. Stations of this class must not transmit to or accept public messages from other stations. No rates are authorized. Licenses of this class are required for all transmitting radio stations used for broadcasting news, concerts, lectures, and such matter. A wave length of 560 meters is authorized for such service, and a wave length of \$85 meters is authorized for broadcasting crop reports and weather forecasts, provided the use of such wave lengths does not interfere with ship to shore or ship to ship service.

Paragraph 58, page 55, which reads: "If a coast station, the operators shall hold a commercial secondgrade license, or higher" (par. 67) is amended, effective January 10, 1922, to read: "Operators of limited commercial stations shall hold a commercial second-class license or higher."

D. B. CARSON, Commissioner of Navigation.

Approved.

HERBERT HOOVER, Secretary of Commerce.

COUNTERFEIT WEATHER FORECASTS.

Whoever shall knowingly issue or publish any counterfeit weather forecast or warning of weather conditions falsely representing such forecast or warning to have been issued or published by the Weather Bureau, United States Signal Service, or other branch of the Government service, shall be fined not more than \$500 or imprisoned not more than 90 days, or both. (Act of Mar. 4, 1909, c. 321, 35 Stat., 1088).—Submitted by Weather Bureau.

RADIO WEATHER SERVICE FROM KHRUN, JAPAN.

A radio weather bulletin and storm-signal service has been instituted at Kiirun radio station, in latitude 25° 08' N., longitude 121° 45' E., call letters JFK and wave length 600 meters. This station transmits daily a weather bulletin at 11.30 G. M. T. (civil) and storm signals at 12.05 G. M. T. (civil). The station a' transmits the warnings issued by the Central Meteorological Observatory at Tok immediately after being received. No charge is made except in cases where the warnings are transmitted specially at the request of ships. The messages are sent out in English and are transmitted three times in succession, each being preceded by the signal QST sent three times. The warnings contain the following: Typhoon or low atmospheric pressure, date, time, position of center, reading of barometer at center, and direction of progressive motion; or locality, warning, and remarks.—*From Hydrographic Bulletin*,

RADIO SERVICE BULLETIN.

HIGH-POWER RADIO INSTALLATIONS, BRAZIL.

Two high-power radio stations are shortly to be established in Brazil, each being equipped with a 1,000-kilowatt Alexanderson high-frequency generator. One of these stations is being erected at Rio de Janeiro to communicate directly with Europe; the other is being erected at Para to communicate with the United States.—From Hydrographic Office, Dec. 7, 1921.

RADIO TIME SIGNALS, EIFFEL TOWER, FRANCE.

From November 15, 1921, the automatic radio time signals from Eiffel Tower radio station are preceded by a series of the letter "V" sent from 0923 to 0924, then the words "Observatoire de Paris," sent from 0925 to 0926. The instants 0928, 0929 are indicated by the end of a group of three dashes, according to the cadence adopted by the International Time Conference of 1912. The semiautomatic radio time signals from this station indicate, by means of a dot, the instants 1045, 1047, and 1049; also 2245, 2247, and 2249, according to the cadence of the old-time signals from Eiffel Tower radio station.—From Hydrographic Office, Dec. 21, 1921.

RADIO COMPASS STATIONS, PEN-AR-ROCH, FRANCE.

The service of the radio compass station at Pen-ar-Roch, Ouessant, in (approximately) latitude 48° 26' 27" N., longitude 5° 05' 37" W., has been resumed.—From Hydrographic Office, Dec. 21, 1921.

INFORMATION FROM THE BERNE INTERNATIONAL BUREAU.

Italy.—By letter of September 29 last the Italian office states there has been established a regulation by which each ship which is in need of a compass bearing asks the coast station interested the coast charge to be paid for the service. Also, in order to have a way of checking in case of dispute, the coast station, as well as the ship station, transcribes the bearing on a radiotelegram form. The radio station of Brindisi will be closed to public service beginning December 15, 1921. The service of this station will be assumed by the S. Cataldo di Bari station.

Portugal.-The coast station of Lisbonne (Lisbon) is reopened to service.

France.-The legal hour was reestablished during the night of October 25-26 last.

Belgium.—The legal hour was reestablished during the night of October 25-26 last. Persia.—The rate for the stations of Bahrein, Bushire, Henjam, and Lingah is 0 fr. 60 per word, beginning December I, 1921.

APPLICATIONS OF RADIO TELEPHONY IN THE LIFE-SAVING SERVICE USING A COLL ANTENNA.

The Bureau of Standards has been cooperating with the United States Coast Guard in the development of radio telephone apparatus to maintain communication between a motor lifeboat and a shore station. The great importance of maintaining reliable communication between the shore and a boat engaged in rendering assistance to a wrecked ship is obvious. The proper navigation of such a boat in a storm makes it highly desirable to reduce to a minimum any apparatus above the deck level. No loose wires above, in, or under the boat were permissible, since this would interfere with the proper handling of the boat and the throwing of lines. The installation of a small antenna of the ordinary elevated type even a comparative point of view. After considerable investigation it was decided that a coil antenna offered the best prospects.

A coil antenna need not be insulated from the earth to give good results. Two vertical pipes, grounded at each end and having a connection made across their upper ends, have been successfully used as a coil antenna. Several years ago two members of the staff of the Bureau of Standards developed a coil antenna for use on a submarine,

RADIO SERVICE BULLETIN.

nected at each end to the metallic hull of the vessel. The vessel was thus equipped with a single-turn coil antenna of which the hull formed a part, and successful communication has been carried on with a submarine so equipped.

A similar arrangement has been used on the motor lifeboat for the Coast Guard. The boat on which the installation was made was a 36-foot gas-engine driven boat equipped with a heavy metal keel. The receiving and transmitting set was installed on the boat as far forward as possible. From the set a wire was run forward and connected to the keel, while two wires, heavily insulated, were run aft along the guards and connected to the keel. A particular kind of a coil antenna was thus formed, of which the keel constituted a part. This arrangement was satisfactory from a navigating point of view.

The transmitting apparatus used at the shore station and on the boat were identical and consisted of a 5-watt radio telephone transmitting set. The wave length used for transmission from the boat was 380 meters, and the wave length used for transmission from the shore station was 675 meters. The receiving equipment used included an amplifier, using three stages of radio-frequency amplification and two stages of audiofrequency amplification, and was specially designed for the wave length used. The apparatus installed on the boat can be made very compact.

On November 15 a demonstration was made at Atlantic City before representatives of the Coast Guard on a Coast Guard motor lifeboat equipped with this type of apparatus. When the boat was 6 miles from shore, good communication was maintained with the shore station. This distance is sufficient for the ordinary needs of the Coast Guard. If a greater distance is to be covered, it will, of course, be possible to use a transmitting set more powerful than the small 5-watt set used in these tests. The results of the tests were regarded as very satisfactory.

Consideration is being given by the Coast Guard to the installation of radio telephone equipment at a number of the more important stations.—Submitted by Bureau of Standards, Nov. 30, 1921.

WEATHER REPORTS.

Masters of all vessels are reminded that all communications concerning weather should be forwarded to the Weather Bureau, Washington, D. C., and if sent by radio or telegraph should be addressed "Govt. Observer." Under the subject "Weather" should be included all information of a meteorological nature, including reports on barometric pressures, winds, force and direction, and movements of all air strata. Forms and instructions for reports can be obtained from the Weather Bureau, Washington, D. C.

All hydrographic information, which includes reports on ice, wrecks, derelicts, floating obstructions, and important changes in aids to navigation, should be addressed to the Hydrographic Office and any of its branch offices by mail, and to any of the following naval radio stations by radio, addressed "Govt. Hydro."

RADIO ICE SIGNALS, SWEDEN.

Radio ice signals for the coast of Sweden are transmitted daily at 13.15 (middle European time) by Karlsborgs radio station, on a 2,500-meter wave length. The signals are transmitted according to the following code:

	Main group AA.			Main group BB.	
Group J.	Group II.	Group III.	Group I.	Group II.	Group III.
AA 18 18 18	LS IS IS	IS IS IS	BB IS IS IS	IS IS IS	IS 18 18
	Main group CC.		М	ain group DD.	
Group I.	Group II.	Group III.	Group L.	Group II.	Group III.
CC 18 18 18	IS IS 18	18 18 18	DD 18 IS 18	18 18 18	IS IS 18

The letter "I," replaced by either a figure or the letter "x," signifies ice, as below; the letter "s," replaced by either a figure or the letter "x," signifies effects on navigation, as below:

Ice reports.

Effects on navigation.

0=Clear of ice. 1=Brash ice. 2=Spread drift ice. 3=Floe ice. 4=Land ice. 5=Drift ice. 6=Difficult land ice. 7=Difficult drift ice. 8=Pack ice. 9=Hummocky ice. x=Not known.

0=Open for navigation.

1=Navigation difficult for sailing vessels.

2=Navigation difficult but practicable for sailing vessels assisted by tugs.

3=Navigation closed to sailing vessels.

4-Navigation only practicable for powerful steamers.

5=Navigation only practicable with the assistance of ice breakers.

6=Channel kept open by ice breakers.

7=Navigation closed.

8=Navigation held up.

9=Conditions not known on account of fog, snow, etc.

14 RADIO SERVICE BULLETIN. Channels and districts for which the signals are given.					
Main group.	Subgroup.	Number or letter "x" in subgroups.	Channels and districts.		
	I	1st and 2d 3d and 4th 5th and 6th	Channel from sea to Karlsborg. Waters outside of Rödkallem. Channel to Lulea through Tjeuholms-sundet.

1	1	1st and 2d 3d and 4th	Waters outside of Bremö. Channel: Bremö to Draghällans Light. Alnösundet.		
BD	u	1st and 2d. 3d and 4th 5th and 6th	Waters outside of Lilljungfrun. Waters around Eggegrund. North channel to Geffe.		
	m	1st and 2d. 3d and 4th 5th and 6th	Oregrundsgrepen. Waters in sight of Grundkallen Light Vessel. Waters outside of Söderarm.		
1	I	[1st and 2d 3d and 4th 6th and 6th	Waters outside of Sandhamn. Channel: Sandhamn to Stockholm. Waters outside of Landsort.		
cc	п	(1st and 2d 3d and 4th 5th and 6th	Channel: Landsort to Stockholm. Channel: Hävringe to Orelösund. Kalmarsund, north of Kalmar.		
	ш .	[1st and 2d 3d and 4th 5th and 6th	Kalmarsund, south of Kalmar. Southern entrance to Kalmarsund. Waters outside of Kalshamn.		
	I	(lst and 2d 3d and 4th 5th and 6th	Southern entrance to Oresund. Flint Channel. Waters outside of Helsingborg.		
DD	u	(1st and 2d 3d and 4th 5th and 6th	Northern entrance to Oresund.		
	ш	(1st and 2d 3d and 4th	Waters outside of Vinga. Channel: Vinga to Gothenborg. Waters outside of Smogen.		

In each subgroup the first and second figures, the third and fourth figures, and the fifth and sixth figures are given together, or in place of a figure the letter "x."

The conditions for a channel or district is found by looking up the two figures, or in the place of a figure the letter "x," in its respective main group and subgroup. When conditions are the same in all channels and districts under one main group, for example, clear of ice, open for navigation, only main group letters are given, followed by the figures as "AA 00." If the conditions should be the same in all channels and districts in several main groups, the letters of the main group would be sent out, followed by the figures indicating the conditions, as "CC DD 00."

Information is also sent when any of the principal light vessels or buoys on the coast has been withdrawn or are not functioning and of wrecks that constitute a danger to navigation. The radio information is given thus: First, the preliminary signal (-...) to call attention; then the call signal for all stations from Karlsborgs Radio Station (CQ CQ CQ de SAJ SAJ SAJ) repeated three times, and thereafter the words "Swedish ice report," with the information following:

For example:

--.-- CQ CQ CQ de SAJ SAJ SAJ CQ CQ CQ de SAJ SAJ SAJ CQ CQ CQ de

RADIO SERVICE BULLETIN.

RADIO COMPASS STATIONS INSTRUCTIONS.

The Naval Communications Service will furnish radio bearings to mariners of all vessels equipped with radio telegraph transmitters. While the use of these bearings should not lead a mariner to neglect other precautions, such as the use of the lead, etc., during a fog, these bearings will greatly reduce the dangers to navigation for mariners who are compelled for any reason to proceed during foggy or misty weather. These radio compass stations are provided, primarily, to assist the mariner in closing the land during fog or poor visibility, but they may also be used to obtain the positions of vessels at sea in radio compass range, about 150 miles, when for any reason positions can not be obtained by other means.

The maximum distance for which bearings from these stations are accurate is 150 miles. But accurate positions can not be plotted when more than 50 miles from the shere on Mercator charts, for the Mercator projection introduces a distortion of the true bearing. Charts based on Gnomonic projection are essential to plot correctly long-distance radio bearings. Such charts are now under construction by the Hydrographic Office, and until they are available mariners may use the Mercator chart for long-distance bearings, applying necessary corrections, which may be obtained by various methods, one of which is fully explained on the backs of H. O. Pilot Charts of the North Atlantic Ocean for February, 1921; North Pacific Ocean for May, 1921; Indian Ocean for June, 1921; and Central American waters for March, 1921.

Radio compass stations are divided into two classes:

(a) Single stations, operating independently and furnishing a single bearing. These stations are located with the view of giving service to ships at a distance of not over 150 miles from the station.

(b) Harbor entrance groups. All stations in harbor entrance groups are connected to and controlled by the master station. All stations of the group take bearings simultaneously, and these bearings are transmitted to the ship requesting them by the control station. The purpose of these stations is to lead mariners to the light vessels off harbor entrances.

Where only one radio compase station is available, the mariner may fix his position by two or more bearings from the station with the distance run between or may use the bearing as a line of position or as a danger bearing. Or the bearing may be crossed with a line of position obtained from an observation of an astronomical body to establish a fix.

Wave lengths.—All independent and group radio compass stations keep watch on 800 meters. Only this wave should be used to call and work with these stations.

Calling a radio compass station.—To obtain a bearing from independent radio compass stations, call the station from which the bearing is desired in the usual manner and request bearings by means of the conventional signal given hereafter. Simultaneous bearings from two or more compass stations can be obtained by making the call include the other compass stations desired. To obtain bearings from the harbor entrance, compass stations carry out the procedure previously given. The compass control station only will answer.

Conventional signals .- The following abbreviated signals will be used:

Signal.	Meaning.
QTE	What is my true bearing? Your true bearing is —— degrees from ———— radio compass station.

RADIO SERVICE BULLETIN.

(a) Procedure in detail.—A ship calling the radio compass station or compass control station should make the abbreviation "QTE," ("What is my bearing?"). This request will be answered by the radio compass station or control station, and when ready to observe the radio bearing it will send the signal "K," indicating to the ship to commence "testing;" i. e., repeating its distinguishing signal for a period of 50 seconds. The signal should be made slowly with the dashes considerably prolonged.

(b) The testing should be made on 800 meters, upon the completion of which the ship should await reply from the radio compass station.

(c) The radio compass station or control station will then reply, repeating the abbreviation "QTE," ("Your bearing from ——— was —— degrees"), followed by the bearing in degrees given by a group of three figures 000 to 359, indicating the true bearing in degrees of the ship station from the radio compass station, and then the time group giving the time of observations in local standard time. In the case of more than one radio compass connected by land line only the station originally called will answer. This station will combine all the bearings taken by itself and associated station into one message, which gives each bearing observed immediately after the name of the station making the observation.

All radio compass stations transmit on 800 meters.

Example.—A ship (call letters KVA) desires to get bearings from the Delaware Bay entrance group (call letters NSD). The following procedure is used:

 _______NSD_NSD_NSD______KVA_KVA_KVA_KVA______QTE

 _______KVA_____NSD_K

This method is the only authorized procedure for calling, answering, and testing and should be followed exactly. Such signals as MO __ V __ and other test signals are not authorized for radio compass traffic. The testing period of 50 seconds should not be exceeded. Mariners who do not follow the prescribed procedure exactly occasion delay to themselves in obtaining bearing and to other mariners who may be waiting for an opportunity to use the radio compass stations.

Danger from reciprocal bearings.—Attention is invited to the fact that when a single bearing is furnished there is a possibility of an error of approximately 180 degrees, as the operator at the compass station can not always determine on which side of the station the vessel lies. Certain radio compass stations, particularly those on islands or extended capes, are equipped to furnish two corrected true bearings for any observation. Such bearings when furnished vessels may differ by approximately 180 degrees, and whichever bearing is suitable should be used.

Caution.—Mariners receiving bearings which are evidently the approximate reciprocal of the correct bearing should never attempt to correct these bearings by applying a correction of 180 degrees, as such correction would not include the correction necessary on account of deviation at the compass station. An error as large as 30 degrees may be introduced by mariners applying an arbitrary correction of 180 degrees to such bearings. Vessels receiving bearings manifestly requiring an approximate 180-degree correction should request the other bearing from the radio compass

RADIO SERVICE BULLETIN.

Bearings, except in the case of approximate reciprocal bearings, should be accurate within 2 degrees of arc provided the transmitting equipment on board vessels is tuned sharply to 800 meters. Operators should use sufficiently wide coupling to obtain low decrement. If radio transmitters are not tuned sharply, it is difficult to obtain bearings that are sufficiently accurate for navigational purposes. When bearings from three or more compass stations are not over 2 degrees of arc in error, but do not meet at a fixed point, the geometric center of the triangle formed by the bearings can generally be taken as the approximate position of the vessel.

Mariners until thoroughly familiar with the system are advised to use radio compass stations frequently, especially in clear weather, when positions of veasela can be accurately fixed in order to accustom operators to the procedure and to acquaint themselves with the degree of accuracy and dependability of bearings furnished by the radio compass stations.

Reports.—In order that the operation of shore radio compass stations may be checked, mariners obtaining bearings are requested to forward a brief report to the Director Naval Communications, Navy Department, Washington, D. C., containing the following particulars:

Name of ship.

- 2. Name of radio compass station.
- 3. Date and local standard time at which radio bearing was taken.
- Bearing given by radio compass station.
- 5. Estimated position of ship at above time and dates by methods other than radio.
- 6. The probable degree of accuracy of the estimated position.
- Weather conditions at above time.
- Remarks, if any.
- 9. Signature of master or responsible navigating officer.

There is no charge for bearings furnished by the United States naval radio compass stations.

RADIO COMPASS STATIONS.

The following stations are within the continental limits of the United States:

Name of station.		Position.	
Atlantic coast.		- , ,,	
Bar Harbor	NBD	44 18 36 N.	
Cape Elizabeth (Portland), Me	NAB	68 11 27 W. 43 33 59 N.	
Houcester, Mass	NAD	70 11 59W. 42 35 19 N.	
eer Island, Mass	NAD	70 41 08 W. 42 21 15 N,
