WBEN Offers Best In Radio

WBEN, the Buffalo Evening News radio station, is giving listeners in Western New York, near-by Pennsylvania and Ontario the highest type of radio service.

Through the facilities of the National Broadcasting Company's red network, the greatest array of stars ever to face microphones is being presented over WBEN. Local programs featuring the best talent in Buffalo also are heard.

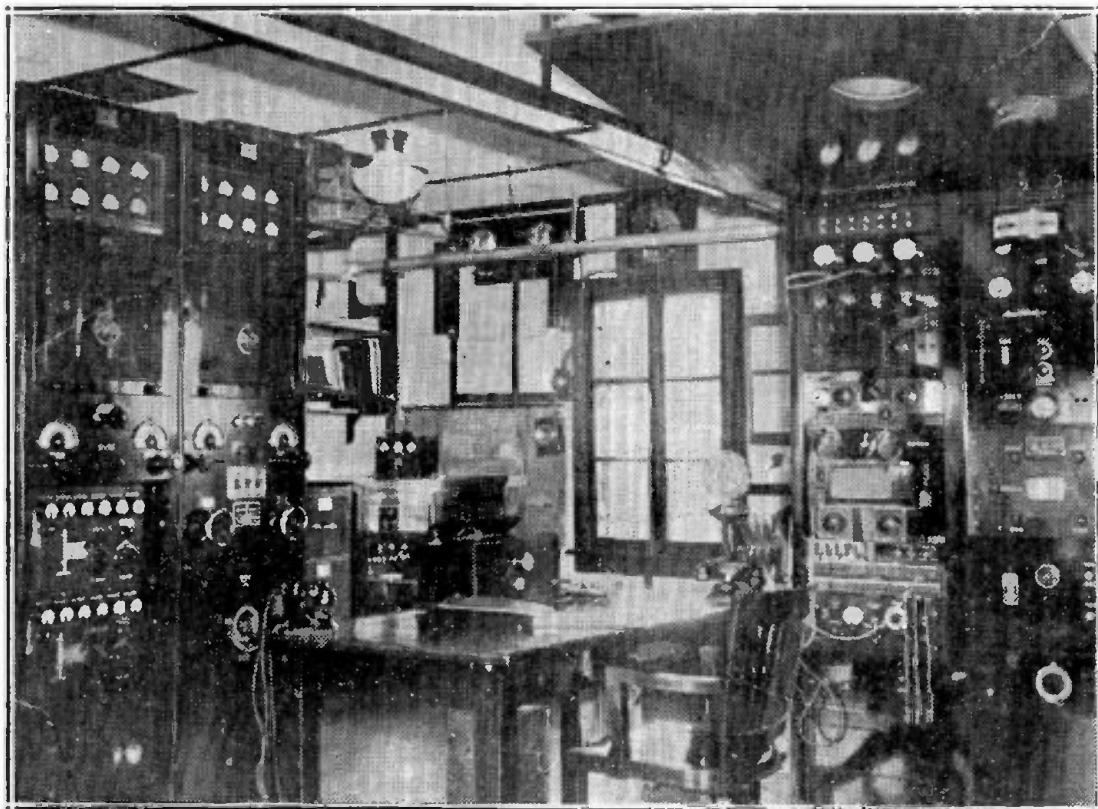

In addition to this radio entertainment, WBEN keeps its listeners posted on happenings throughout the world with its regular news bulletin service supplied by the Buffalo Evening News. The Associated Press and Universal Service, two of the world's greatest news-gathering agencies, and Buffalo Evening News bureaus in strategic news centers such as Albany, New York, Washington, Ge-

neva, Vienna, Warsaw and the largest staff of local reporters on any paper between New York and Chicago, assure WBEN audiences of the latest and most accurate news reports.

But the effectiveness of this entertainment and educational service would be lessened were it not for the fact that WBEN's technical equipment is kept at a high standard of efficiency. Nothing is left undone to give the WBEN audience programs which are transmitted with the highest possible fidelity.

A new RCA transmitter, which is able to give 100% modulation, sends WBEN's signal through the ether waves at the station's maximum power. But the transmitter itself is not the only feature of WBEN's equipment.

Programs are constantly monitored by latest automatic devices which insure a

A corner of the control room at WBEN'S Martinsville transmitter.

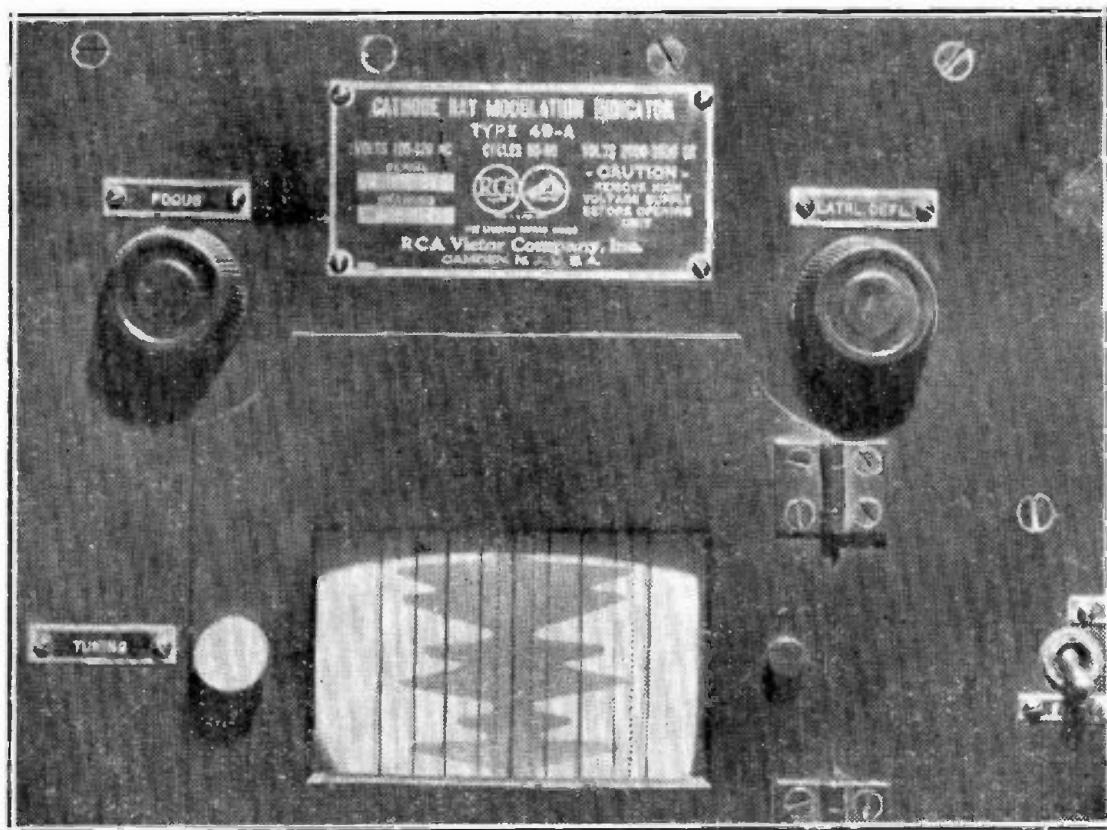

high quality of transmission. An automatic crystal control keeps WBEN always exactly in its wave channel.

Technicians in WBEN's control room in the Hotel Statler studios are guided in monitoring programs by an automatic "over-modulation" meter, which, by flashes of a neon tube, indicates how the programs are going through the transmitter and on the air. At WBEN's transmitter in Martinsville, an oscilloscope guides the technician still further. Whenever the station is on the air this instrument translates sound waves into light waves and the face of the oscilloscope gives a picture of the program. The slightest distortion—distortion which the human ear could not detect, distortion which no radio receiver could pick up, is called to the attention of the technician.

There is, thus, no guesswork on the part of the technicians. Possibility of

human error is eliminated. The latest and most accurate scientific instruments govern transmission.

As a matter of fact, WBEN is transmitting a signal which far exceeds the range of the present day radio receiver. This may not seem to be of importance or interest to the layman, but it really is a vital factor. Just as a person likes to have his automobile engine produce more horsepower than he actually utilizes because he gets better performance, the radio listener gets more enjoyment from radio entertainment if the station to which he is listening is emitting a signal which nears perfection. On the older type of receivers WBEN would sound better than another station which may not take the same care in transmission. It means, too, that the person who has the latest and perhaps the most expensive type of radio, gets more fullness of tone when he listens to station WBEN.

Oscilloscope pattern of music transmitted over WBEN. The technicians strive to keep the edges of the pattern clean-cut at all times.

WBEN Continues To Pioneer In Ultra Short Wave Broadcasting

By EARNEST H. ROY
WBEN Technical Staff

Backed by several years' experience in the art of ultra short wave transmission, Radio Station WBEN this winter will continue its pioneering efforts in this relatively new and important field of radio work.

With the installation of a new RCA, crystal-controlled transmitter, which will emit a 100 watt signal, and installation of a specially designed 70-foot antenna atop Hotel Statler, which will be 370 feet above the street level, some very interesting results are looked for.

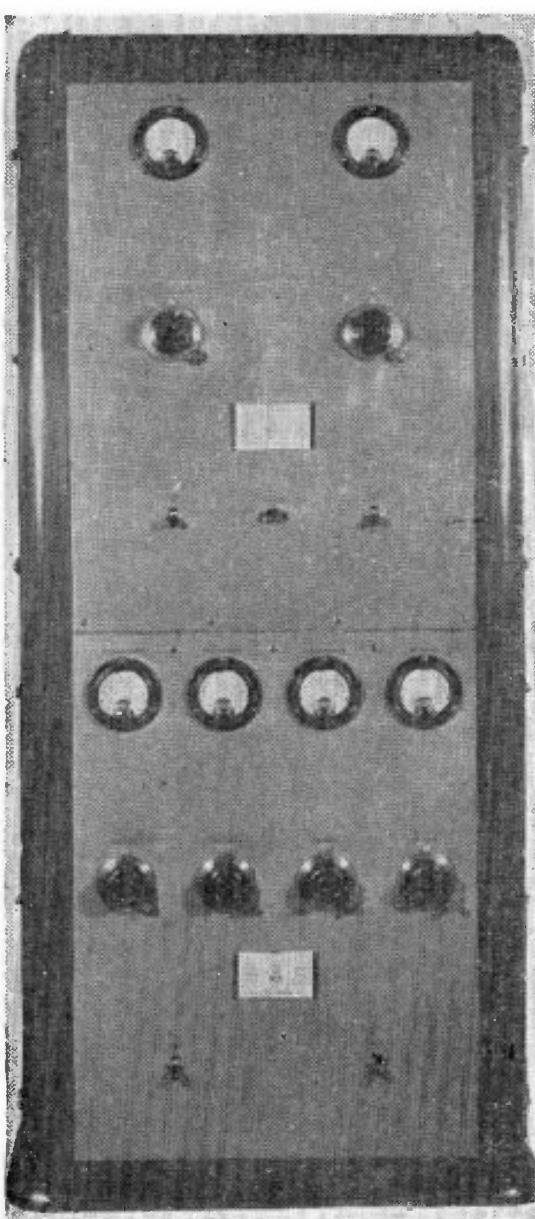

WBEN's ultra high frequency experimental work is carried on through Station W8XH, and also through W8XD, a portable, self-contained transmitter. Frequently, these stations work in conjunction but WBEN is planning exclusive programs of an interesting character for W8XH.

These should be received by a constantly increasing audience because some of the leading radio manufacturers have been encouraged, by this experimental activity, to develop and offer in Western New York radio sets capable of picking up the high fidelity signal which W8XH will broadcast on 41 Megacycles, or 7.3 Meters.

When W8XH went on the air in March, 1934, WBEN announced that its objectives would be to (1) obtain higher fidelity in transmission; (2) do away with fading and static; (3) develop "on-the-spot" broadcast service by broadcasting events taking place beyond the range of telephone lines, and (4) to aid in the development of television.

It already has been ascertained that ultra-short radio waves—those below nine meters—have tremendous penetrating powers. For instance, ultra-short radio waves are received with no apparent fading when traveling through a steel tunnel, or under railway viaducts. Persons with receivers in their automobiles are well aware of the fading from these two causes when listening to regular broadcast bands. And, it also has been discovered that reception of ultra-short waves is about the same day or night,

winter or summer, and that perfect reception is possible even during thunder storms—barring, of course, man-made interference which is subject to control or elimination.

New transmitter of W8XH

Man-made Static Can be Eliminated

By RALPH J. KINGSLEY
Technical Supervisor of WBEN

A few years ago when radio sets were operated by storage batteries, and loud speakers resembled the old-fashioned phonograph horn, a few miscellaneous squawks and rattles bothered the radio enthusiast not at all.

The listeners who manipulate the dials of the modern streamlined radios of today, however, should enjoy their radio programs without interference in spite of electrical "squawks" in the form of man-made static. With the advent of modern electrical appliances in the home, man-made static has been constantly on the increase.

Radio reception difficulties include static, fading, weak signals and man-made static. Weak signals have been overcome by increased amplification. Automatic volume control is a dependable means of overcoming fading. Static, however, we still have with us.

Man-made static is extremely annoying, especially when one realizes that such things as the electric washing machine, refrigerator and vacuum cleaner may cause a roar of interference in the loud speaker. Any electrical appliance which uses an electric motor, heating pads or even a loose electric lamp in its socket will cause interference. A number of short clicks indicate that someone near by is dialing a telephone.

These annoying rattles, depending on the source, may be heard in radio receivers over a large area or they may be confined to one's own block or home.

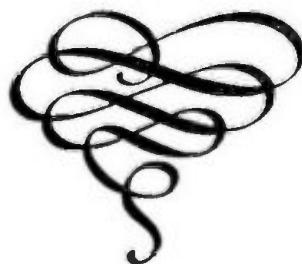

"What can be done about it?" "What is the solution?", persons troubled by this man-made interference ask. Fortunately there is a satisfactory way of dealing with most of the electrical disturbance.

The leading manufacturers of electrical equipment are producing apparatus which will not cause radio noise. A person who is purchasing an electrical appliance should make sure that it will not produce noise in his receiver. As an example, a well-known vacuum cleaner now has a noise-suppressing device as standard equipment.

Furthermore, there are available many inexpensive and satisfactory devices that suppress noise by filtering the noise out of the output of the receiver.

In some cases, the source of the disturbance may be quite some distance away from the listener's receiver and, therefore, difficult to locate. If, after eliminating all possible source of interference in the listener's home, the noise is still evident, a competent radio service man should be called in. If the service man is equipped with the proper apparatus to trace down interference, he can locate your trouble for you in short order.

One very good rule to remember is that practically all noise producing electrical equipment can be quieted by the use of proper filtering at the source. A good radio service man can do the job. A little coöperation between yourself and your neighbors can do wonders in eliminating this troublesome condition.

STATION LOG

All radio stations in the United States, Canada, Mexico, and the West Indies are listed below. While only the call letters of the station appear in this list, location, name of owner, and power of the station can be obtained by referring to the alphabetical list of stations. Similarly, if the city in which the station is located is the only information heard one may find the call letters and wave length by referring to the listing of stations by cities.

WBEN

THE STATION THAT
OFFERS THE BEST
IN ENTERTAINMENT -
ANY HOUR OF THE DAY!

The same world-wide organization that brings you the intelligently-reported, carefully-edited stories in the Buffalo Evening News is behind the news bulletins broadcast at convenient intervals over WBEN. Fresh news from home and abroad is broadcast daily at 9 A. M., 12:30, 2:30, 6, and 11 P. M. Sundays at 12:30, 6:30 and 11 P. M. And when something momentous occurs the bulletin is broadcast instantly from the News editorial room, whatever the hour. The disseminating of late news via radio and newspaper go hand in hand, and the Buffalo Evening News gives the greatest service through the convenient facilities of its own station, WBEN.

**RADIO STATION OF THE
BUFFALO EVENING NEWS
900 Kilocycles + 333.1 Meters**
