# INTRODUCTION

Here once again, in improved format, is the CONFIDENTIAL FREQUENCY LIST, now in its 7th edition. Recognized throughout the world as the undisputable leader and most comprehensive list available, CFL-7 has been considerably expanded and now contains well over 30,000 CW, voice RTTY and FAX frequencies in the spectrum 4 through 28 MHz.

While intended mainly as a means of station identification, the opportunity has been taken to update and develop many details of scheduled press and weather broadcasts, time signals, navigation warnings and similar material of interest to monitors.

Users will notice that the 'Power' column, which appeared in the previous editions, has been omitted. The reasons for this: given favorable propagation conditions, even 'flea power' will find its way around the world; also the power of many stations is unknown and even when such details are published a statement such as '1-40 kW' is not of much assistance. Either you hear it or you don't.

New features include the International List of Callsigns and an extended List of Abbreviations. Several useful charts show the ICAO regions (including those not generally published across the Asian land mass). Another chart displays the sixteen NAVAREAS of the world. A world time zone map is also included.

CFL-7 does not list amateur or broadcasting transmitters, with the exception of some broadcasters outside the allocated broadcasting bands. Also excluded, reluctantly, were the many hundreds of unknown transmitters using CW 'tactical' callsigns and sending only ciphered messages, unless, unusually, there is some clue as to their location.

## USING THE FREQUENCY LIST - COLUMN BY COLUMN

### Frequency

For CW, RTTY and FAX transmissions the 'assigned' (by the ITU) frequency ( $f_0$  or 'dead space') is given. For SSB, however, the 'carrier' frequency - the frequency at which clear speech is resolved - ( $f_0 \pm 1400$  Hz) is shown. LSB is 1400 Hz above  $f_0$ ; USB is 1400 Hz below. Hence many stations have a double entry, perhaps two separate RTTY channels, 2.8 kHz (2 X 1400 kHz) apart approximately, depending on the accuracy with which their frequency has been reported.

If an 'out of band' frequency is heard, e.g., a marine coast station transmitting a CQ marker in a fixed station band, it is probably an image signal arising from an inherent defect in the receiver - even some expensive receivers are notorious for their strong false signals. The more powerful transmitters sometimes emit harmonics (multiples of the assigned frequency) or other spurious emissions ('spurs').

### Mode

RTTY modes have by now proliferated to such an extent that it is no longer

practical to indicate each one in a general list such as CFL. Indeed many stations habitually transmit in three or four different RTTY modes in the course of 24 hours, with seemingly random choice of normal or reverse keying.

For these reasons the suffixes 'N' (normal keying) and 'R' (reverse keying) have been omitted. Also omitted are the suffixes 'c' (Cyrillic) - on the reasoning that Russian transmissions are likely to be in Cyrillic format anyway - and 'e' (encrypted) since military stations could be expected to encrypt the bulk of their traffic.

RTTY speeds are given in bauds, the equivalent wpm speeds being:

| Baud rate | wpm |
|-----------|-----|
| 45.45     | 60  |
| 50.00     | 66  |
| 57.00     | 75  |
| 75.00     | 100 |
| 100.00    | 133 |

The frequency shift/speed figures and other designations such as ARQ and FEC given under the Mode column are those officially listed or most frequently reported. But monitors should bear in mind that changes of mode are always possible, indeed likely. However, the CCITT normal shift/speed is 425/50 and many transmissions adhere to this standard. ARQ is generally used by marine and INTERPOL stations and is easily recognized by its 'chirp, chirp' note.

The latest demodulators available today resolve shift, speed and sense automatically and the fortunate possessor of such equipment can ignore most of the above details.

Some stations transmit a CW marker tape or engage in CW chat before sending their normal RTTY traffic. Such stations are listed as RTTY, but those that transmit both CW and RTTY traffic are given as CW/RTTY.

Multiplex or multi-carrier modes, in which a number of simultaneous very narrow band transmissions are radiated by a single transmitter, are mainly confined to military installations. With the highly specialized sending and receiving equipment needed six or even more channels may occupy a bandwidth of less than 2 kHz.

Mainly used for RTTY (shown as MPX/R in the mode column of the Frequency List), the techniques are also applicable to SSB (shown as MPX/S), where one channel is used for 'command' purposes. The frequency quoted is the center frequency of the group.

The Al\* indication for Hellschreiber transmissions has been retained although there have been no recent reports of reception in this mode -- a rasping sound -- for some time. Hellschreiber, 'clear writer,' was a pre-WW II German machine, but these stations are listed now only under occasional Beijing, PRC frequencies. The receiver output can be resolved only with a special 'telewriter' using a paper roll.

FAX drum speed is generally 576 rpm, although 288 rpm with alternate line scanning is sometimes used. The frequency shift is normally  $\pm$  400 Hz.

## Call

Callsigns are usually stable and normally remain unchanged for many years. When, suddenly, the 'wrong' callsign appears on a frequency it may usually be accounted for by a patching error at the operating room or transmitter, or the selection of the wrong call slip.

Suffixes after a callsign such as /H1 or /X9 refer to the (directional) aerial in use at the time.

Voice callsigns are shown (for lack of space in the Callsign column) in quotes under the Location column.

There are a number of 'collective' callsigns in use, mainly military, such as NUKO, NERK, FAAA etc. Where known, their meanings are given in the List of Abbreviations.

Coast stations (marine) have different methods of allocating callsigns to their many frequencies. Some (e.g., Portishead Radio, England) use a separate call for each CW, USB and RTTY frequency; others use a single call to cover every frequency and mode in use; still others use a conventional callsign only for their CW frequencies, with a station number for RTTY and a voice call for USB.

## **Location**

The spelling of foreign names is always a problem. The solution adopted in this volume is to use the normal anglicized spelling for well known places such as Moscow, Rome or Ostend. Less common names are normally spelled as they appear in the ITU lists and the London 'Times' atlas.

To save space, certain countries with long titles, e.g., Democratic People's Republic of Korea, the Algerian Democratic and Popular Republic and similar have been abbreviated to their more common names of North Korea or Algeria. Their full titles will be found in the International List of Call Signs included in this volume.

Where known, the operating location of a radio station is given first, with the transmitter site, if different, in parenthesis.

For transmitters in the USA and dependencies, the two letter abbreviation for the state only is shown.

Some radio stations take their names from some small village, inland from a port or distant from a large city, where it is convenient for the aerials to be erected; some examples:

Castelnau-d'Orbieu, France - a village 15 miles SE of Toulouse  
Croughton E.C.C., England - near the village of Barford  
and the USAF Upper Heyford AB, SW of Northampton  
Portishead, England - 8 miles west of Bristol  
Pozuelo del Rey, Spain - a village about 23 miles east of Madrid  
Aranjuez, Spain - a town 27 miles south of Madrid  
Rota, Spain - on the Atlantic Coast, across Cadiz Bay from Cadiz City  
'Shanwick', Scotland/Ireland. 'Shanwick' is the call used by the Ocean  
Air Control Center, which services the eastern half of the N. At-  
lantic (up to 30° W). The Center is located at Prestwick on the  
west coast of Ayrshire, Scotland and the associated radio trans-  
mitters are at Ballygirreen, near Shannon, in Ireland.

Attention is drawn to some names that can easily be confused:

Addu Atoll, Maldives Is.  
Attu, Aleutian Is.

Dhaka (was Dacca), Bangladesh  
Dakhla (was Villa Cisneros), Western Sahara

Dharan, Nepal  
Dhahran, Saudi Arabia

Male, Maldives Is.  
Mali, country of Central Africa

Niger (pronounced Neejaire), capital Niamey, Central Africa  
Nigeria, capital Lagos

Tripoli, Syria  
Tripoli, Lebanon

Riyadh, Saudi Arabia  
Ryazan or Riazan, USSR  
Riyam, South Yemen

Common alternative spellings include Tallin (Tallinn), Jakarta (Djarkarta), Indonesia and Mogadishu (Mogadiscio), Somalia. El Djaza'ir, commonly seen on RTTY printouts, is the native name for Algiers, Algeria.

Some countries have adopted new names in the past few years, these include:

Sri Lanka (Ceylon)  
Cote d'Ivoire (Ivory Coast) - the French spelling is now in-  
sisted upon  
Madagascar, once known as the Malagasy Republic, has now  
settled for the Democratic Republic of Madagascar.

Similarly, some cities have changed:

Antananarivo (was Tananarive), Madagascar  
Antsirane (was Diego Suarez), Madagascar  
Urumqi (was Wulumqi), PRC  
Volgograd (was Stalingrad), USSR

There are, of course many other changed names, but they fall outside the scope of this CFL.

As far as possible, standard terminology has been adopted in an attempt to classify the service of many radio stations, bearing in mind that some stations perform more than one service:

...Air = an Air Force ground station (AX, FA or FX) for communication with military aircraft or other military ground stations

...Aeradio = a civil aviation ground station (FA) for ATC communications with aircraft

...Naval = a naval land station (FC or FX) for communication with naval vessels or other naval land stations

...Radio = a civil maritime coast station (FC) for communication with, normally, merchant vessels

#### Service

The ITU, Geneva, has introduced some new two-letter abbreviations for the type of service provided, but only the main services of each station are shown in the frequency list. Refer to the List of Abbreviations.

#### Remarks

Where appropriate, the first entry in the Remarks column, always enclosed in square brackets, is the military or civil RTTY identifier, usually between 3 and 6 letters. Frequently used Routing Indicators are shown in a similar fashion.

The first letter of a routing indicator is R; the second indicates the country of origin (e.g., F = France, P = Portugal); the third letter gives the geographical area in which the station is located (except in the instance of the USA); the fourth, the major relay station and the fifth letter onwards subsequent relay stations and the ultimate destination.

Also included in the Remarks column are the transmission times of regular press, weather and navigation warning broadcasts. Additional information is provided in the Marine, Aircraft, Meteo/Weather, AFTN Network, Time Signals, Letters/Numbers and Channel Markers headings in this Introduction.

### TYPES OF COMMUNICATIONS COMMONLY HEARD ON THE HF BANDS

#### Marine

Many hundreds of marine Coast Stations have been added to this volume, which is now the most comprehensive list of its kind. Every known CW coast station with a power of 1 kW or over, is included.

Since the last edition of CFL many vessels have been equipped with INMARSAT (marine communication satellite) and it is to be expected that there will be a resultant decrease in traffic on the higher frequency bands.

In the USA and RTTY duplex channel lists, the paired ship-reply-frequency is shown in parentheses after the channel number.

It is quite common for CW to be heard in the RTTY bands since many coast stations transmit a CW marker for aural identification. Similarly, RTTY may be heard on the CW bands. Initial ship/shore communication may be set up on CW before the actual traffic is passed on RTTY, reverting to CW for acknowledgment.

Many of the USSR coast stations still operate on their older listed frequencies as well as those currently appearing in the latest ITU lists. Therefore, both the 'old' and 'new' frequencies are shown for these stations.

The HF frequencies of Inland Waterway or Limited Coastal Stations (FCL) are all listed, but the 2,000 or so stations are too numerous to show individually in

this volume. Users are advised, however, that they are all contained in a booklet published by the Association of DX Reporters (ADXR), 1008 Plymouth Road, Baltimore, MD 21208, USA.

It is of interest to note that the remote control of several coast stations from a central point is a growing trend, and may be found already in Canada, France, Spain and the UK.

For the organization of navigation warnings, the world is divided into sixteen NAVAREAS. A selected coast station in each NAVAREA broadcasts the navigational warnings for that area according to schedule. Brief details of these broadcasts is given to the Remarks column, and a chart showing the sixteen areas is provided.

### Time Signals

The times of transmission and hours of service are now included. For convenience, both A1A (CW) and A2A (MCW) emissions are listed as CW in the Mode column.

### Meteo and Weather

Stations broadcasting regular meteorological bulletins are designated as BM (Bureau Meterologique) in the Service column. As far as possible, the word Meteo in the Remarks column indicates that the station transmits only regular meteorological bulletins, frequently in coded form. If no broadcast times are given it may be assumed that the station transmits several times throughout the 24 hours.

Wx indicates that the station transmits occasional weather bulletins at set times, usually in plain language, but is principally engaged in other traffic, e.g., ship/shore.

FAX stations transmit weather maps, ice charts, barometric pressure analyses and press photos -- even comic strips on occasion.

### Piccolo

Piccolo is a specialized type of RTTY transmission, now appearing in more than one form. Piccolo has a distinct musical tinkling combined with a burbling sound; some types have more 'notes' than others. It is widely used by British Embassies in its original form; the types with only a few 'notes' are believed to be of Soviet origin.

### Letters and Numbers

PAB is an abbreviation used to denote 'Phonetic Alphabet Stations', so called because the letters transmitted are those of the International Phonetic Alphabet.

So far as is known, these stations are all operated by Mossad, the Israeli secret service, from Israel for the benefit of their agents abroad. The transmissions are tape generated, letter by letter, and are easily recognized by the exact reproduction of each letter. At one time it was noteworthy that 'November' was always rendered very distinctively as 'Novembeer'.

'Numbers' stations can be divided into two main types: Spanish, which originates in the Americas, and German or Slavic languages, from Europe.

The frequencies used are scattered right through the HF spectrum although the aviation and broadcast segments are usually avoided. The frequencies listed in CFL, especially of the Spanish stations, may vary by 2 or 3 kHz.

Broadcasts usually start on the quarter hour, and are frequently preceded by a long repetition of a two or three letter or number callsign.

Messages are normally coded by the 'one time pad' method and are therefore undecipherable except by the recipient, who holds the corresponding pad.

### Broadcasting Stations

Broadcasting stations are included in CFL at about every 50 kHz, where they exist, but only outside the defined international broadcast bands. These stations may be helpful to monitors using receivers with analog frequency readouts, but for comprehensive details of these and all other broadcasters reference

should be made to a guide such as the World Radio and Television Handbook (WRTH).

## Aeronautical

### ICAO Regions

The ICAO regions used for long distance HF communications between aircraft and the major ATC centers are shown on the charts included in this volume. Russian and Chinese entries should be treated with caution, however. Although the information printed is the latest available, there are some discrepancies to be found even in official frequency lists. The ICAO areas shown across the Soviet Union and the PRC are not yet officially implemented.

### AFTN Network

The Aeronautical Fixed Telecommunications Network provides dedicated circuits between airfields, Air Traffic Control and Flight Information Centers. Although most communications are by telex, whether over landlines or radio, both CW and voice are brought into the AFTN network when necessary.

The network handles flight plans, departure and arrival messages, aircraft passenger lists, freight and fuel loads and requirements, weather messages, diversions and all matters affecting airline, military and private aircraft movements and safety.

### LDOC

The LDOC (Long Distance Operational Control) stations are generally owned and operated by the airline companies or by specialist firms such as ARINC or International Aeradio.

These stations provide a direct pilot to dispatcher/met/engineering personnel link and some systems can also be used for passengers' phone patches.

### Channel Markers

All HF monitors will have heard the many single letter channel markers with their seemingly endless repetition of U..U..U or C...C and other letters

Channel Markers have been operating for at least 35 years. Some run for 24 hours a day, others for shorter regular periods, some at weekends only and some for periods as short as 5 minutes every 2 hours.

For a long time these markers were referred to as 'beacons' or 'single letter beacons' (SLBs), but continued listening has shown that, sometimes regularly, sometimes irregularly, most markers emit a series of morse figures, or data, at intervals. Some have been heard to communicate with other stations.

Direction finding and deductions based on propagation characteristics have placed at least some of these markers in the Soviet Union. But despite much speculation embracing submarines to satellites, automatic weather stations to tide level indicators, their purpose remains a mystery.

One marker has been heard to break off its normal transmission and send a message under the UMS callsign (Soviet submarine HQ, Moscow); this is the most positive clue so far as to their origin.

These markers are therefore listed as 'unknown'.

As a variation, there will be found, spread through the spectrum, some half dozen channel marker 'clusters', each consisting of ten or twelve marker transmissions separated by .5 or 1 kHz and sending a different single letter, including accented letters.

An interesting feature of these clusters is that the same letter occupies the same position in each cluster. For example, if the letter sent on the lowest frequency of one cluster is 'S', then 'S' will be on the lowest frequency in every cluster. Then, 1 or .5 kHz up will be another letter, but again the same letter in every cluster.

These clusters transmit throughout the 24 hours, although not all of the letters in each cluster are normally audible all the time. This perhaps indicates different locations for each letter. It is also suggested that these clusters may be propagation indicators.

Geoff Halligey

**4063.0 - 4438.0 kHz -- MARITIME MOBILE**

**4063.0** The band between 4063.0 and 4140.5 kHz is divided into 26 channels spaced 3.1 kHz apart and assigned numbers from 401 to 426. These are ship USB duplex transmitting channels and are paired with similarly numbered Coast Station USB channels operating between 4357.4 and 4434.9 kHz.

## ABOUT THE AUTHOR

Geoff Halligey started his radio career in 1933, as a wireless operator on trawlers operating out of Hull, on England's East Coast. His voyages took him to Iceland, Greenland, Bear Island and the Barents Sea. During World War II he was a radio and D/F operator at British civil airports; in his spare time he acted as monitor of German Abwehr radio transmissions.

After the war he joined British European Airways as Radio Officer and flew to most countries of Europe, North Africa and the Middle East.

Since retirement he has kept up his interest in radio and regularly writes for RCMA newsletter and LWCA's LOWDOWN, both published in the USA.

---

**SPECIAL THANKS** go to the many monitors worldwide who gave of their time and effort in making this book as accurate and up-to-date as possible. In particular, we must mention: I. R. Boueton, Dr. H.M. Beumer, Dr. Daniel T. Boatright, Richard H. Brown, Mark Chinsky, Nicolas Delaunoy, Eli Dutilli, Bill Grant, Fred Hetherington, Ian Kerr, Alex Moore, David Ross, A.J.Richardson, W. C. Thompson, Colin Woodford, and D. Worthy. We would also like to extend our appreciation to various members of the Association of DX Reporters (ADXR), Canadian International DX Club (CIDX), Radio Communications Monitoring Association (RCMA) and SPEEDX. Computer liaison for this book was ably provided by Barbara Smith and Paul Lannuier.

**YOUR HELP** is needed to make the **CONFIDENTIAL FREQUENCY LIST** more useful to you, the reader. All contributions are eagerly sought and carefully considered in revising each edition. Please send your contributions to: CFL Editor, GILFER SHORTWAVE, 52 Park Avenue, Park Ridge, NJ USA.

## OTHER GILFER PUBLICATIONS

- **RADIO RECEIVER—CHANCE OR CHOICE**

by Rainer Lichte

Scores of reviews and specs (thru real-life testing) by world renown radio engineer. Explanation of terms and how testing was done. Profusely illustrated with explanatory charts and pictures. Must book for comparison shoppers. Includes reviews on Icom, Kenwood, Yaesu FRG-8800, Panasonic, Sony ICF-2010, Realistic, Magnavox/Philips D 2999, JRC receivers and many more. Reviews 75 pieces of equipment: table top and portable receivers as well as many accessories.

**ISBN: 0-914542-16-8 ..... 224 pp. .... \$18.50**

- **MORE RADIO RECEIVER—CHANCE OR CHOICE**

by Rainer Lichte

More incomparable reviews. Same straightforward manner as in the original book above (but without explanation of terms) and specifications are directly comparable to *Radio Receiver—Chance or Choice*. Includes Japan Radio Co.NRD-525, Icom R-7000, Grundig Satellit 400/650, Kenwood R-5000 and Panasonic RF-B60. Fourteen complete reviews in all.

**ISBN: 0-914542-18-4 ..... 96 pp. .... \$12.95**

- **THE WORLD IS YOURS**

by Samuel R. Alcorn

Enjoy Listening to International Radio

A reader-friendly non-technical book about the SWL hobby. Tells specifics of each band, each radio broadcasting station and where and when to hear music and sports programs. A 24-hour listing of English language broadcasts. Glossary. More.

**ISBN: 0-914512-14-1 ..... 64 pp. .... \$5.95**

- **WORLD BROADCAST STATION ADDRESS BOOK**

by Gerry Dexter

Over 1150 addresses of broadcasting stations throughout the world as well as the name of an individual at most stations. Excellent help in getting verification of listening (QSL's). Postage rates, how to request, sample report forms. Fully illustrated.

**ISBN: 0-914542-15-X ..... 128 pp. .... \$8.95**
